The Particle Theory and Changes of State When Heat is Added

State of matter	Change of state	Movement of particles	Forces holding particles together	How close particles are together	What happens when heat is added?
Solid		Particles _____ in fixed positions	Very strong	Close	
	M_____				As heat is added the particles start to move faster. Eventually they move fast enough to overcome the forces holding them in fixed positions. They are able to roll over each other and the matter becomes a liquid
Liquid		Particles able to roll over each other	Strong	Close	
	B_____				As more _____ is added the particles move even faster and further apart. Eventually the forces holding the particles close together are overcome and the particles can move completely apart. They move r_____ and r_____ becoming a gas.
Gas		Particles move _____ and _____	Weak	Far apart	

Questions

In which state of matter do Particles move fastest?

How can you make particles move faster?

What has to be added to make matter melt or boil?

What has to be taken away to make matter freeze or condense?

What two words describe the movement of particles in a gas?

Movement of particles in a solid can be described as _____ in fixed Position.

Why does a gas expand and take up more space when heated? Think about the particles?
