Soluble	A solid which has ‘passed into’ a liquid	Un-dissolved	The un-dissolved solid which collects in the filter paper after filtering.
Solution	Anything which is able to dissolve.	Chromatography	The only types of solid which can be separated by filtering.
Solute	A liquid with a solid dissolved into it.	Magnet	A method of separating dissolved substances according to their solubility.
Solvent	A solid which is dissolved into a liquid.	Condenser	A piece of equipment which could be used to separate paperclips and sand.
Solubility	A liquid which can have a solid dissolved into it.	Filter paper	A piece of equipment used to turn gas into liquid.
Temperature and stirring	How easily a solid dissolves.	Distillation	A pieces of equipment used in both chromatography.
Crystals	Factors which affect how easily a substance dissolves.	Different boiling points	A method of separation used to acquire pure water.
Evaporation	The form that our solute is left in after being separated from the solution.	Evaporating basin	Properties that different liquids have, which allow us to separate them by distillation
Temperature	A way of separating a dissolved solid and liquid.	Saturated	A piece of equipment which can be used to ‘grow’ crystals.
Filtrate	A factor which would affect the rate of evaporation.	Insoluble	A solution in which no more solute can dissolve.

Residue	The liquid acquired after filtration	Dissolved	A solid which is unable to dissolve.
