1. A _____biologist is a person who studies tiny living things
2. Do all these scientists agree that the water will be safe? **Yes / no**
3. In Sewerage, there is a thousand to a million times higher concentration of v_____, b_____ and d_____
4. Is it true to say 'dam water has never been toilet water'? **yes / no** …… Why?

   _____
5. How many contaminants (toxic things) do they measure for? _____
6. What are some examples of these contaminants?

   _____
7. Which step do they talk about first? M_____
8. The water is forced through the tubes at **high / low** pressures
9. What is the next step they talk about? R_____ O_____
10. How could viruses get through? _____
11. How many times does the filtration have to reduce viruses by? _____
12. What do they use as disinfectant after filtration? (2 things)

    _____
13. What is, overall, the main problem with recycled water as a source?

    _____

14. A microbiologist is a person who studies tiny living things
15. Do all these scientists agree that the water will be safe? **Yes / no**
16. In Sewerage, there is a thousand to a million times higher concentration of viruses, bacteria and drugs
17. Is it true to say 'dam water has never been toilet water'? **yes / no** …… Why? Water is always cycling through the water cycle
18. How many contaminants (toxic things) do they measure for? 350
19. What are some examples? Pesticides, herbicides, bacteria, radioactive substances
20. Which step do they talk about first? microfiltration
21. The water is forced through the tubes at **high / low** pressures
22. What is the next step they talk about? Reverse Osmosis
23. How could viruses get through? If there is a hole in the membrane
24. How many times does the filtration have to reduce viruses by? A billion
25. What do they use as disinfectant after filtration? Hydrogen Peroxide and UV radiation
26. What is, overall, the main problem with recycled water as a source? Community opposition and lack of education on the topic
27.

Filtered water **Name _____**

1. A _____biologist is a person who studies tiny living things
2. Do all these scientists agree that the water will be safe? **Yes / no**
3. In Sewerage, there is a thousand to a million times higher concentration of v_____, b_____ and d_____
4. Is it true to say ‘dam water has never been toilet water’? **yes / no** …… Why?

   _____
5. How many contaminants (toxic things) do they measure for? _____
6. What are some examples of these contaminants?

   _____
7. Which step do they talk about first? M_____
8. The water is forced through the tubes at **high / low** pressures
9. What is the next step they talk about? R_____ O_____
10. How could viruses get through? _____
11. How many times does the filtration have to reduce viruses by? _____
12. What do they use as disinfectant after filtration? (2 things)

    _____
13. What is, overall, the main problem with recycled water as a source?

    _____

Filtered water **Name _____**

1. A _____biologist is a person who studies tiny living things
2. Do all these scientists agree that the water will be safe? **Yes / no**
3. In Sewerage, there is a thousand to a million times higher concentration of v_____, b_____ and d_____
