Matter

Chemistry is the study of _____.

Matter is anything that takes up _____ and has _____.

Mass is how much _____ an object has (measured in grams).

An objects properties are things you can use to _____ it.

The state of matter=whether it is a Solid, _____ or _____.

Density= How h_____ compared to an object of the same _____.

Malleable= ca be hammered into _____.

Ductile=can be s_____ into wires.

_____= Can it be squashed into a smaller space (volume).

Fluid=able to flow and takes the _____ of the container it is in.

_____= will shatter if hammered.

Chemical Properties of Matter

The chemical properties of matter describes how a substance _____ with other types of matter.

For example:

Burns in _____. This is called combustion.

Rusts or c_____.

Reacts slowly or _____.

A chemical property of the metal iron is that it rusts slowly in contact with air.

	Property type	
Statement	Physical	Chemical
Carbon dioxide gas can flow		
Ice is less dense than liquid water.		
Carbon will burn in oxygen to give Carbon dioxide		
Hydrogen gas reacts explosively with oxygen if ignition temperature is reached.		
Copper will corrode to copper oxide slowly if left exposed to air.
