Polar

Polar bears rely on sea ice to live, travel and hunt

Small bumps on their footpads, called papillae, help them grip the ice

Their long, thick, curved, sharp claws help ther kill and eat their prey

Their fur is hollow and transparent. It reflects visible light and looks white, reflecting the snow.

Adaptations of a Polar Bear

- Their fur is hollow and transparent in order to why their fur looks white in the snow.
- Small bumps on their footpads, called papillae,
- Long, thick, curved claws help them to kill and
- Large paws distribute their weight evenly. This
- Their skin beneath their fur is black, helping th
- Thick layers of fur and body fat also help to ke
- They have developed into strong swimmers, ab in the hunt for prey.

As they are well insulated, they can overheat if they try to move too quickly, they tend to walk slowly whenever possible

They have two layers of fur and thick layer of body fat to keep them warm

They are strong swimmers and divers to travel between icebergs and catch prey

Their skin is black, this helps them absorb heat

r to reflect visible light and camouflage them. This is

llae, help them grip to icy surfaces.

and eat their prey.

This is very important when walking on ice!

g them absorb heat and keep warm.

› keep them warm.

, able to navigate between icebergs and other hazards
