The pH Scale **Cut and Stick**

Match each of the different substances to the correct position on the pH scale.

Cut out and match the additional labels to complete the diagram.

Base or Alkali?: **Acids** can be **neutralised** by a **base** substance when they react together. Many bases will not dissolve in water (**insoluble**), but those that do dissolve in water (**soluble**) are called an **alkali**.

hydrochloric acid

cola

shampoo

lemon juice

orange juice

toothpaste

water

washing up liquid

black coffee

milk

baking soda

vinegar

bleach

neutral

strong alkali

weak alkali

strong acid

weak acid

The pH Scale **Cut and Stick Answers**

Please note: If you have used this resource to support a practical investigation then some of these answers may vary depending on the brand or type of substances you have used.These answers provide a generalised guide only.

hydrochloric acid – pH 0 [strong acid]

lemon juice – pH 2

vinegar – pH 2

orange juice – pH 3

cola – pH 3

black coffee – pH 5 [weak acid]

shampoo – pH 5

milk – pH 6

water – pH 7 [neutral]

toothpaste – pH 8

baking soda – pH 9 [weak alkali]

washing up liquid – pH 10

bleach – pH 13 [strong alkali]

Please note: If you have used this resource to support a practical investigation then some of these answers may vary depending on the brand or type of substances you have used.

These answers provide a generalised guide only.
