KS3 **Scientific Investigation Loop Cards**

skills	An idea that is tested during an experiment.
hypothesis	The data that is collected during an investigation.
results	What is 'drawn' from a set of results?
conclusion	Data can be presented in this way to make it easier to read.
graphically	Once an investigation has been carried out, this is written about the method.
evaluation	This is a step-by-step account of what to do during an investigation.
method	These are used to carry out an experiment.
apparatus	This type of data can be presented in a bar chart.

twinkl.co.uk

discontinuous	This type of data can produce a bell curve.

continuous	These are used to work out results of an investigation.

calculations	These are analysed during an evaluation.

strengths and weaknesses	These need to be analysed to avoid accidents during the investigation.

risks and hazards	The bell curve can also be called...

normal distribution	This should be done to data to help determine if it is accurate.

repeated	These results don't fit the pattern so should not be included.

anomalies	These are what are changed during an investigation.

twinkl.co.uk

variables	These are what remain the same during an investigation.
controls	This will be done to results that have been collected in order to draw a conclusion.
analysis	These are taken from apparatus in order to get results.
readings	The idea at the start as to what the results of the experiment may be.
prediction	What you see during an investigation that will help you draw a conclusion.
observations	The application of techniques to get results from an investigation.
