# KS3 The Rock Cycle **Loop Cards**

| | |
|---|---|
| **small and rounded** | This causes rocks to wear away and contains acidic gases like sulphur dioxide. |
| **acid rain** | The breakdown of rocks due to living organisms, such as burrowing animals or trees. |
| **biological weathering** | Rocks are eroded by chemicals when they react with their minerals. |
| **chemical weathering** | Rocks, soil and other solid materials wear away because of this. |
| **erosion** | Rocks are broken down because of temperature changes or because of the effects of the wind or waves. |
| **physical weathering** | The process whereby rocks are created, destroyed or changed. |
| **The Rock Cycle** | The way in which rocks are moved from one area to another, such as by flowing water. |
| **transport** | A rock that is easily weathered by chemicals. |

| | |
|---|---|
| **limestone** | When water expands and contracts due to temperature changes. |

| | |
|---|---|
| **freeze-thaw** | Basalt and granite are examples of this rock, which are formed from magma or lava. |

| | |
|---|---|
| **igneous** | Limestone and shale are examples of this rock type, which often have layers and fossils. |

| | |
|---|---|
| **sedimentary** | Slate and marble are examples of this rock type. Made when one rock changes due to heat and pressure. |

| | |
|---|---|
| **metamorphic** | These processes press down the layers of rock to stick particles together, which then creates sedimentary rock. |

| | |
|---|---|
| **compaction and cementation** | These are found in sedimentary rock but not igneous. |

| | |
|---|---|
| **fossils** | Transportation makes pieces of rock look... |

# KS3 The Rock Cycle Loop Cards **Answers**

| | |
|---|---|
| This causes states to wear away and contains acidic gases like sulphur dioxide | acid rain |
| Breaks down rocks due to living organisms such as burrowing animals or trees | biological weathering |
| Rocks are eroded by chemicals when they react with their minerals | chemical weathering |
| Rocks, soil and other solid materials wear away because of this | erosion |
| Rocks are broken down because of temperature changes or wind/waves | physical weathering |
| The process whereby rocks are created, destroyed or changed | the rock cycle |
| The way in which rocks are moved from one area to another such as by flowing water | transport |
| A rock that is easily weathered by chemicals | limestone |
| When water expands and contracts due to temperature changes | freeze-thaw |
| Basalt and granite are examples of this rock; formed from magma or lava | igneous |
| Limestone and shale are examples of this rock; it has layers and fossils | sedimentary |
| Slate and marble are examples of this rock; when one rock changes due to heat and pressure | metamorphic |
| These processes press down the layers of rock to stick particles together, creating sedimentary rock | compaction and cementation |
| These are found in sedimentary rock but not igneous | fossils |
| Transportation makes pieces of rock like this | small and rounded |
