bone	All of the bones in the body make this up.
skeleton	Attached to bones by tendons, these pull the bone to allow it to move as part of a joint.
muscles	This protects the lungs and expands and contracts with breathing.
ribcage	This tough material joins bone to muscle.

twinkl.com

tendon	This tough material joins two bones together.
ligament	The skeleton offers support and …
protection	The skeleton allows the body to stay upright. This is …
support	Acting on a joint, the name of the two muscles that act oppositely.

twinkl.com

antagonistic pair	This protects the brain.
skull	Made up of discs and contains parts of the nervous system.
spine (backbone)	This is in between the ribs and allows the ribcage to move with breathing.
intercostal muscle	This produces new cells and is a soft tissue found inside bones.

twinkl.com

bone marrow	This means something becoming shorter- in this case, am muscle.
contract	This cell contains haemoglobin and transports oxygen.
red blood cell	These allow different parts of the skeleton to move. Humans have synovial ones.
joints	Groups of similar cells that have the same function.

twinkl.com

tissues	A bone in a human body, also called a kneecap
patella	A bone in the human body also called the breastbone.
sternum	A bone in the human body also called the collarbone.
clavicle	Humans and other organisms have a backbone and therefore belong to this group.

twinkl.com

vertebrates	We use these to look at bones and other parts of the body.

twinkl.com

x-ray	These cells are involved in destroying harmful microorganisms.

twinkl.com

white blood cells	Microscopic organisms that can cause harm, such as bacteria or a virus.

twinkl.com

microorganisms	Hips and shoulders are examples of these types of joints.

twinkl.com

ball and socket joints	Knees and elbows are examples of these types of joints.

twinkl.com

hinge joints	Forms the skeleton of a body. A hard, rigid tissue in vertebrates.

twinkl.com

Skeleton and Muscle **Answers**

All of the bones in the body make this up	skeleton
Attached to bones by tendons, these pull the bone to allow it to move as part of a joint	muscle
This protects the lungs and expands and contracts with breathing	ribcage
This tough material joins bone to muscle	tendon
This tough material joins two bones together	ligament
The skeleton offers support and	protection
The skeleton allows the body to, for example, stay upright. This is	support
Acting on a joint, the name of the two muscles which act oppositely	antagonistic pair
This protects the brain	skull
Made up of discs and contains parts of the nervous system	spine (backbone)
This is in between ribs and allows the ribcage to move with breathing	intercostal muscle
Produces new cells, soft tissue found inside bones	bone marrow
This means something becoming shorter, in this case a muscle	contract
This cell contains haemoglobin and transports oxygen	red blood cell
These allow different parts of the skeleton to move, humans have synovial ones	joints
A groups of similar cells which do the same thing	tissue
A bone in a human body, also called a kneecap	patella
A bone in the human body also called the breastbone	sternum
A bone in the human body also called the collarbone	clavicle
Humans and other organisms have a backbone and therefore belong to this group	vertebrates
We use these to look at bones and other parts of the body	x-ray

Skeleton and Muscle **Answers**

These cells are involved in destroying harmful micro organisms	white blood cell
Microscopic organisms that can cause harm such as a bacteria or a virus	microorganisms
Hips and shoulders are examples of these types of joint	ball and socket joint
Knees and elbows are examples of these types of joint	hinge joint
Forms the skeleton, hard, rigid tissue in vertebrates	bone
