Plant **Reproduction**

1a. Complete the diagram by labelling the missing parts. [4]

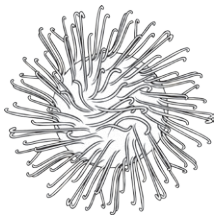

1b. Write the letter **F** next to all of the female parts of the flower. [2]

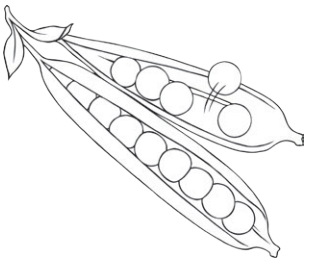

1c. Write the letter **M** next to all of the male parts of the flower. [1]

2. Match each seed with its method of dispersal, by drawing a line. [3]

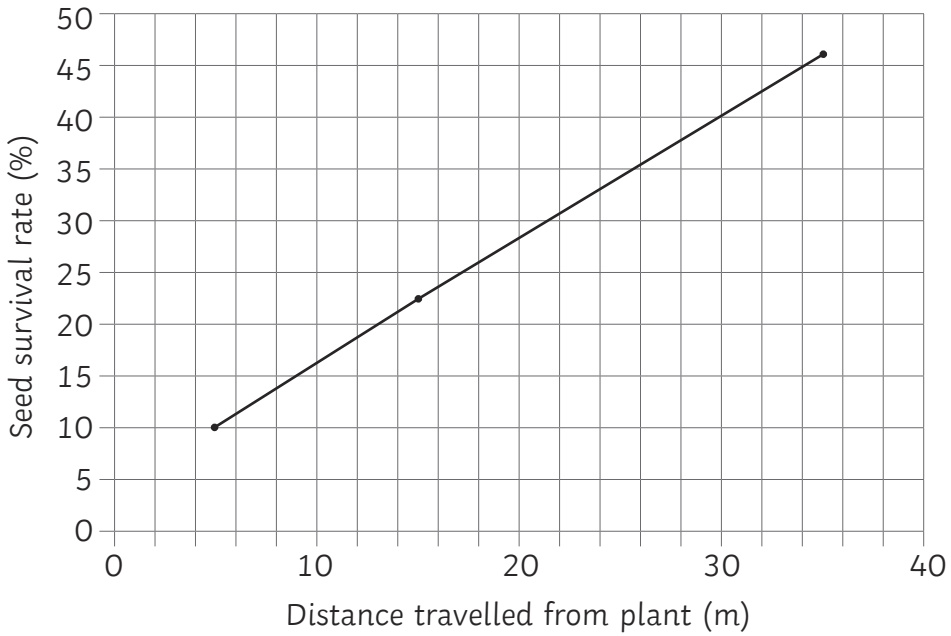

dandelion	apple	burdock	pea

animal fur	explosion	wind	animal droppings

twinkl.co.uk

Some students carried out an investigation looking at seed dispersal. The students measured the distance travelled by sycamore seeds falling from a tree. They then counted how many new trees grew from the seeds.

The graph below shows their results.

3a. Describe any pattern shown in the students results. [1]

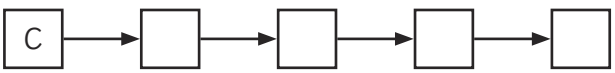

_____

3b. How could the results be improved? [1]

_____

4a. Read the statements below and write the letters to show the correct sequence of events. The first letter has been done for you. [3]

A	The insect lands on the flower and feeds on the nectar
B	Pollen from the anthers is transferred onto the insect's body
C	An insect is attracted to a flower by scent and colour
D	The pollen on the insect sticks to the stigma of the other plant
E	The insect moves to another plant to feed again

twinkl.co.uk

4b. Below are 2 photographs showing stages of insect pollination. Write the letter of the matching descriptive statement in each box, using the table in question 4a. [2]

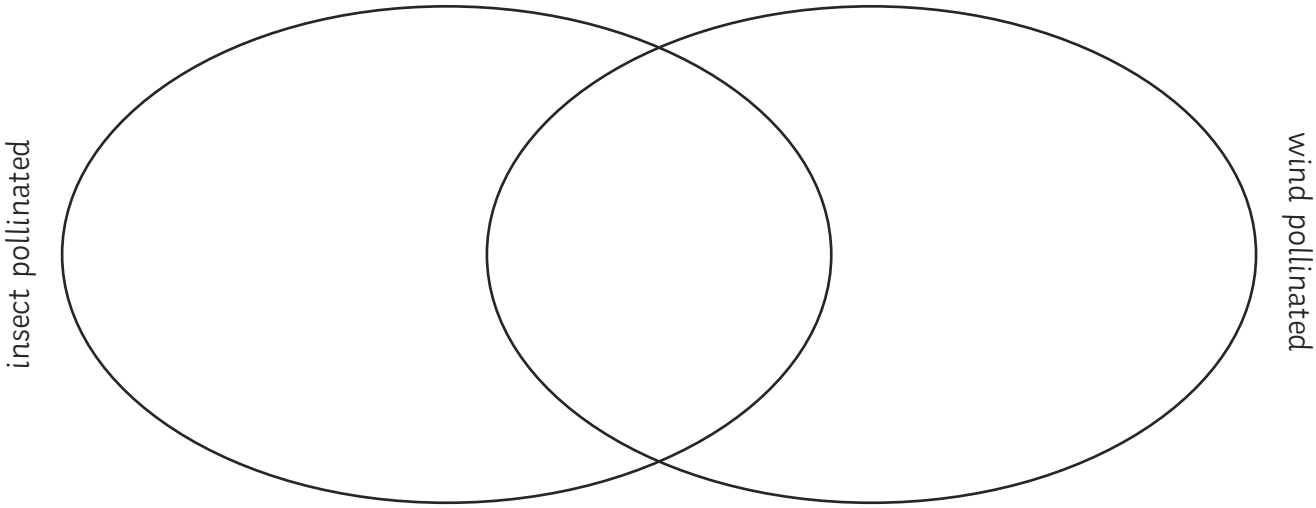

☐

☐

5. Read the statements below and write the letters into the Venn diagram to show whether it is a typical characteristic of insect pollinated or wind pollinated plants. [3]

A	Brightly coloured petals
B	Very long filaments
C	Nectar in the flower
D	Scented flowers
E	Small, dull petals

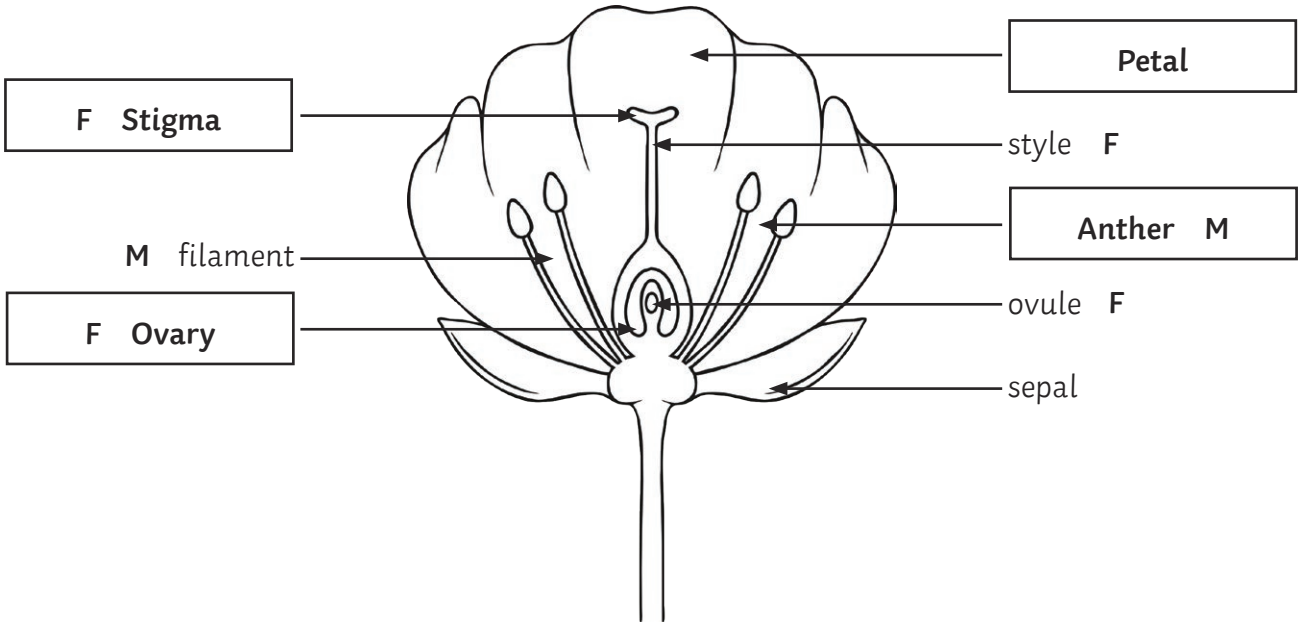

Learning Outcomes (tick if achieved)

Q1	I can describe the structure and function of a flower	
Q2	I can recognise how different seeds are dispersed	
Q3	I can identify patterns in results, and evaluate a scientific method	
Q4	I can sequence and identify the events of insect pollination	
Q5	I can identify features of insect and wind pollinated plants	

Plant Reproduction **Answers**

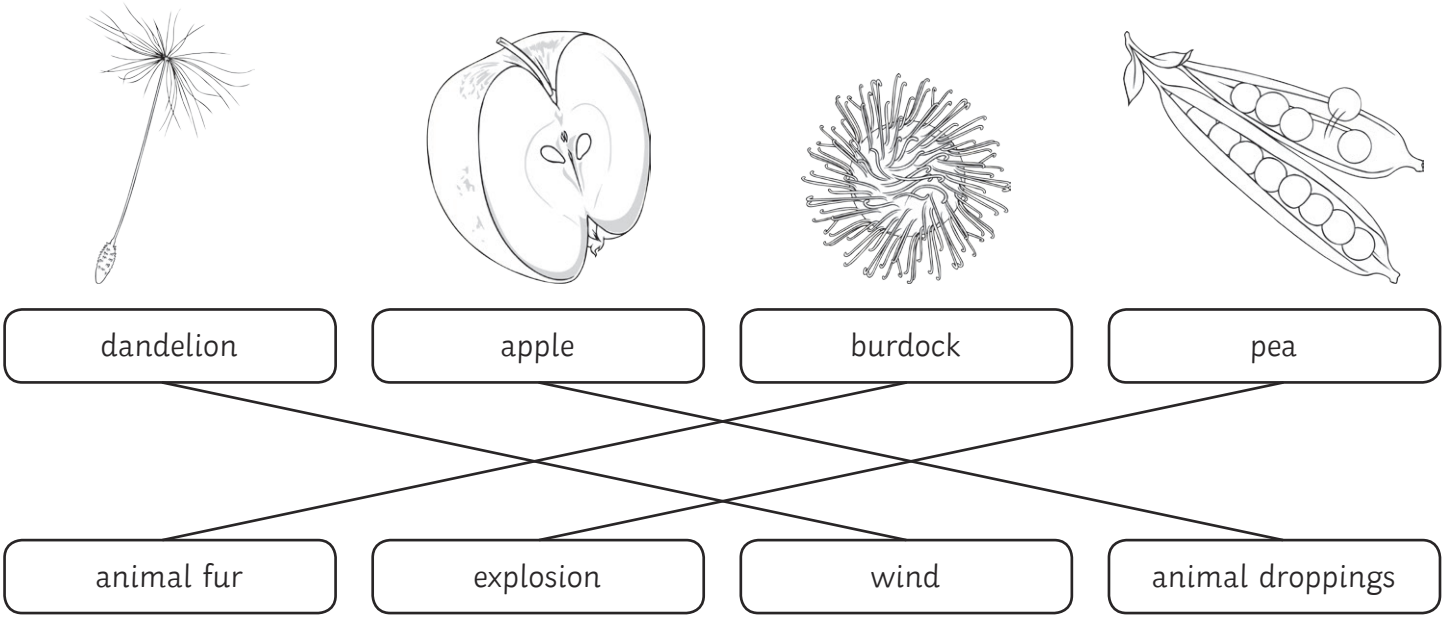

1a. Complete the diagram by labelling the missing parts. [4]

1b. Write the letter **F** next to all of the female parts of the flower. [2]

1c. Write the letter **M** next to all of the male parts of the flower. [1]

2. Match each seed with its method of dispersal, by drawing a line. [3]

3a. Describe any pattern shown in the students results. [1]

The further the seeds are dispersed, the higher the chance of survival

3b. How could the results be improved? [1]

Measure trees growing at more than three distances / compare with secondary data / take repeated readings

4a. Read the statements below and write the letters to show the correct sequence of events. [3]

A	The insect lands on the flower and feeds on the nectar
B	Pollen from the anthers is transferred onto the insect's body
C	An insect is attracted to a flower by scent and colour
D	The pollen on the insect sticks to the stigma of the other plant
E	The insect moves to another plant to feed again

C → A → B → E → D **1 mark each for A before B, B before E, E before D**

4b. Below are 2 photographs showing stages of insect pollination. Write the letter of the matching descriptive statement in each box, using the table in question 4a. [2]

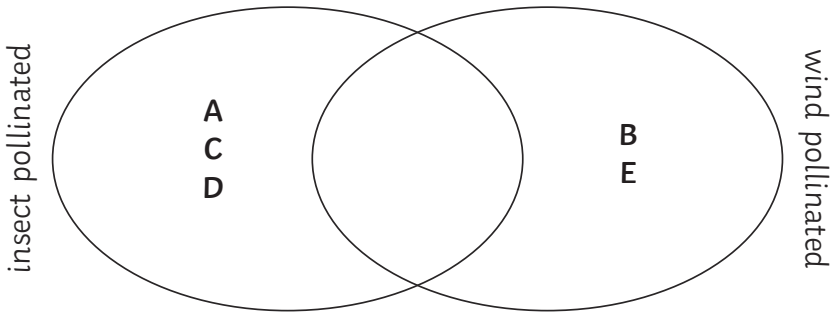

E

B

5. Read the statements below and write the letters into the Venn diagram to show whether it is a typical characteristic of insect pollinated or wind pollinated plants. [3]

A	Brightly coloured petals
B	Very long filaments
C	Nectar in the flower
D	Scented flowers
E	Small, dull petals

1 mark for 1-2 correct
2 marks for 3-4 correct
3 marks for all
