Particles and States of Matter Glossary - **Patience Instructions**

A 5 or 10 minute activity where the aim is to use your knowledge of the glossary key terms to make one continuous link, matching key word with definition.

1. Shuffle the cards.
2. Place 5 starter cards on the desk in a vertical row. Place the rest of the card in a pile, face down on the desk.
3. Look at the 5 starter cards and link any that match. Replace any starter cards to ensure that there are always 5 in a row.
4. Turn over the top card from the pile. Does it link? If yes, place it and look for any further links. If no, place it to the side.
5. Repeat step 4 until all cards link.

Remember to maintain your central 5 for as long as possible.

An Alternative

1. Split the class into 3 teams (number of teams depends on class size).
2. Each team appoints a team leader who collects a set of cards and gives one to each member of their team. Any spares are placed face up on the desk.
3. It is then a race between the teams to see who can make all the links the quickest.

gas	When a liquid changes into a solid.
freezing	A change of state from a liquid to gas.
evaporating	The change of state from a solid to gas.
sublimation	The temperature at which a liquid changes into a gas.
boiling point	The movement of particles in a liquid or gas from a concentrated area to a less concentrated area.
diffusion	The particles are very close together, vibrating and can change places.
liquid	When a gas changes into a liquid.
condensing	To identify how hot or cold something is. One unit is ^{o}C.
temperature	The particles are very close together, have a very small amount of energy and can only vibrate.
solid	The particles are far apart, have a large amount of energy and move rapidly.
