Plants, Photosynthesis and Ecosystems Glossary - **Patience Instructions**

A 5 or 10 minute activity where the aim is to use your knowledge of the glossary key terms to make one continuous link, matching key word with definition.

1. Shuffle the cards.
2. Place 5 starter cards on the desk in a vertical row. Place the rest of the card in a pile, face down on the desk.
3. Look at the 5 starter cards and link any that match. Replace any starter cards to ensure that there are always 5 in a row.
4. Turn over the top card from the pile. Does it link? If yes, place it and look for any further links. If no, place it to the side.
5. Repeat step 4 until all cards link.

Remember to maintain your central 5 for as long as possible.

An Alternative

1. Split the class into 3 teams (number of teams depends on class size).
2. Each team appoints a team leader who collects a set of cards and gives one to each member of their team. Any spares are placed face up on the desk.
3. It is then a race between the teams to see who can make all the links the quickest.

chlorophyll	A community of animals and plants and where they live.
ecosystem	These are found on the underside of leaves and control the opening and closing of stomata.
guard cells	Using chemical reactions to make glucose without the presence of light.
chemosynthesis	The range of organisms in a given area.
biodiversity	Animals that eat plants or other animals in order to survive.
consumers	A process by which plants use carbon dioxide and water to make their own food.
photosynthesis	Plant-eating organisms.
herbivores	A diagram of organisms illustrating the flow of energy.
food chain	Meat-eating organisms.
carnivores	The build-up of toxic materials in a food chain.

twinkl.com

bioaccumulation	Lots of food chains linked together.
food web	Animals that hunt and kill for food.
predators	Plants that make their own food by the process of photosynthesis.
producers	Found on the underside of leaves, allow carbon dioxide into the leaf.
stomata	Another word for poisonous.
toxic	Animals that are killed and eaten by others.
prey	Found on the top side of leaves, contain a lot of chloroplasts and aid photosynthesis.
palisade cells	The area where an organism lives, for example, a pond or hedgerow.
habitat	These are required by plants for healthy growth.
nitrates	Meat and plant-eating organisms.

twinkl.com

carnivores	The green pigment found in chloroplasts, aids photosynthesis.
