Elements, Atoms and Compounds - **Glossary Pairs Instructions**

This is a 5-10 minute activity that can be played several times during the teaching of the course. It is based on the card game 'Pairs'. The pupils work in twos; they place all the cards face-down in a grid. The first person chooses two cards and reads them aloud. If there is a key word with its correct definition, then they keep the cards. Alternatively, if they do not match, they are returned to their original position. The next person has a go. This continues until all the key words are matched with the correct definition.

Atom	When atoms of the same element join together.
Compounds	Make up part of an atom and have a negative charge.
Atomic number	Found in the nucleus of an atom, these do not have a charge.
Elements	Found in the nucleus of an atom, they have a positive charge.
Mixtures	Lists all the elements and groups them together if they have similar properties.

twinkl.com

Atomic mass	The number of protons and neutrons in an element.
Periodic table	These contain different elements or compounds or both.
Protons	These consist of only one type of atom; they cannot be split into anything simpler.
Neutrons	This refers to the number of protons an element has.
Electrons	Consist of two or more elements chemically combined.
