Alloys

☞ **1** Ten of the words in the passage below have been spelt incorrectly. Correct them and then re-read the text.

(Metils) _____ can be changed by adding other metals, and sometimes even non-metals, to them. Some of the metals that we use are (pur) _____ but many are a (mixtir) _____ of different metals. A mixture of two or more metals is called an (aloy) _____. Often the metals are mixed together to make use of their different (propertes) _____. The resulting **alloy** has different properties to the metals it (containes) _____ when used on their own. Solder is an alloy that is used to join metals that require good (electrial) _____ conductivity. It contains tin and lead. Solder has a lower (mealting) _____ point than tin and lead and its (hardeness) _____ is also (differant) _____ from tin or lead.

2 Unjumble the sentence parts and then rewrite the information about alloys in the correct order.

two or more a mixture of An alloy is metals.

_____

the individual metals used to make them. different properties than Alloys have

_____

contains the metals Solder tin and lead.

_____

non-metals contain Some alloys as carbon. such

_____
