Properties of metals

☞ **1** Read the information below and underline the different **properties** of metals.

Metals are good conductors of heat and electricity. They also have high melting and boiling points, and high density. Most metals are ductile, which means they can be drawn into wires. Metals have lustre: when they are cut or polished they are shiny. They are very useful because as well as being strong, they are malleable – most metals can be hammered into sheets or heated and then shaped. Metals have good tensile strength, too – they cannot be easily stretched or pulled apart. All metals are sonorous; they make a ringing sound when hit.

2 Draw a line to match each property with its definition.

Property	**Definition**
dense	Makes a ringing sound when hit
ductile	Can be hammered into shape
tensile strength	Heavy for its size
malleable	Cannot be easily stretched or pulled apart
sonorous	Can be drawn into wires

Metals are good conductors of heat and electricity. This means that they allow heat and electricity to move through them easily.

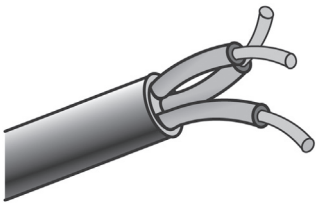

3 The pictures below show some of the uses of metals. Write one property that makes metal useful for each object.
