Neutralisation

When an **acid** and a **base** are mixed, the chemical reaction that occurs is called **neutralisation**. The chemical reaction can be shown in the following word equation:

acid + base ⟶ salt + water

The name of the **salt** depends on the metal in the base used and on the acid used.

☞ **1** Sophia performed an experiment to find out how many drops of sodium hydroxide are needed to neutralise 5 mL of hydrochloric acid. Colour what each of these test tubes would look like if universal indicator was added.

Acid Base

2 What is the name of the base Sophia used in her experiment? _____

3 Sophia slowly added the base to the acid, one drop at a time, making sure she shook the test tube after each drop. Why do you think she needed to shake the test tube after each drop? _____

_____

4 What colour would the solution be when neutralisation had occurred? _____

5 Sophia was not concentrating and put in a whole eye-dropper full of base at one time. The solution turned blue. What pH is the liquid now? _____

6 How could she get the solution back to neutral?_____

_____

7 Use the word bank to complete the word equation for Sophia's experiment.

h_____ a_____ + s_____ h_____ ⟶ s_____ c_____ + w_____

Word bank			
sodium hydroxide	sodium chloride	hydrochloric acid	water
