Turning food into energy

☞ **1** Cross out the incorrect word from each pair in the brackets to complete the passage.

Living things need (sugar / energy) to stay alive. When an animal eats food, its (digestive / circulatory) system breaks the food down into smaller bits called nutrients. These nutrients are picked up by the (atmosphere / bloodstream) and transported around the animal's body to all the different cells. When a substance goes into the bloodstream we call this (absorption / reproduction).

The digestive system breaks down parts of foods called carbohydrates into a type of sugar called (oxygen / glucose). This is a sugar that gives (humans / minerals) and animals their energy needs.

2 Draw a flow diagram that shows what happens to food when it is eaten by an animal. Label the diagram with the letters a–f to represent these steps.

- the food is swallowed
- the food is broken into smaller bits
- the nutrients enter the bloodstream
- the nutrients are taken to the cells
- the nutrients are absorbed by the cells
- the cells release waste products

Turning food into energy CONT'D

Giving cells glucose is like filling a car up with fuel. Glucose gets things moving, providing the animal with energy so that its cells can perform their functions to keep themselves alive and healthy.

3 Complete the answers to these step-by-step questions.

a) What tiny bits are all living things made of? c __ __ __ s

b) How do living things get energy? By taking in f __ __ __

c) What system involves taking in food? The d __ __ __ __ __ __ __ __ system

d) What sugary substance does the body make food into? g __ __ __ __ __ __

e) How is this substance taken around the body? Through the c __ __ __ __ __ __ __ __ __ y s __ __ __ __ m

f) Why do animals eat? To provide all the body's c __ __ __ s with energy to live and grow

4 Rearrange these fragments to write proper sentences.

a) to survive Animals need energy and other living things

_____.

b) The blood in the circulatory system all the body's cells carries glucose to

_____.

c) part in the Glucose plays an important digestive system

_____.

5 Glucose contains energy. List two things that humans need energy to do.

_____

_____
