How do we know about cells?

Cells are tiny parcels of matter that can't be seen with the naked eye. Before people knew about tiny, invisible things such as cells, bacteria (or germs) and viruses, they believed that bad spirits caused diseases.

Over the years, different kinds of **microscopes** have been invented. In the late 1600s scientists began to see cells for the first time. Scientists today use powerful microscopes to find out more about cells, such as what different cells do and how they work. This has helped us to treat illnesses and show people how to stay healthy.

☞ **1** Match each event with the year it occurred, by writing each year from the box beside an event. Hint: Think about the order in which these events would have happened.

1595
1838–39
1663

a) Robert Hooke first discovers the cell. _____

b) Zacharias Janssen invents the compound microscope. _____

c) Theodor Schwann and Matthias Schleiden state that plants and animals are made up of cells. _____

2 **a)** *Microscopic* is a synonym of *tiny*. What is the base word of *microscopic*? Hint: It is mentioned in this Activity sheet. _____

b) List any more 'micro-' words that you can think of.

_____

_____

_____
