Tissues, organs and body systems

Similar types of cells group together in an animal's body to form a **tissue**, such as a muscle, which carries out a particular job. Different tissues group together to form an **organ**.

An organ is a complete unit of the body that has a particular role or job to do. For example, the human heart is a fist-sized organ made up of cardiac muscle and connective tissues. Its function is to pump blood around the body.

Two or more organs work together in groups called **body systems**.

There are body systems for all sorts of things – including for breathing, for moving blood around the body and for digesting food. All the cells in a system need to do their jobs to make the whole system work.

☞ **1** The three organs in this table are found in the human body. In the second column of the table, list anything you know about their function, or what they do.

Organ	Function
heart	
lungs	
skin

Tissues, organs and body systems CONT'D

2 Are systems made up of organs or are organs made up of systems? Write your answer in a full sentence.

_____

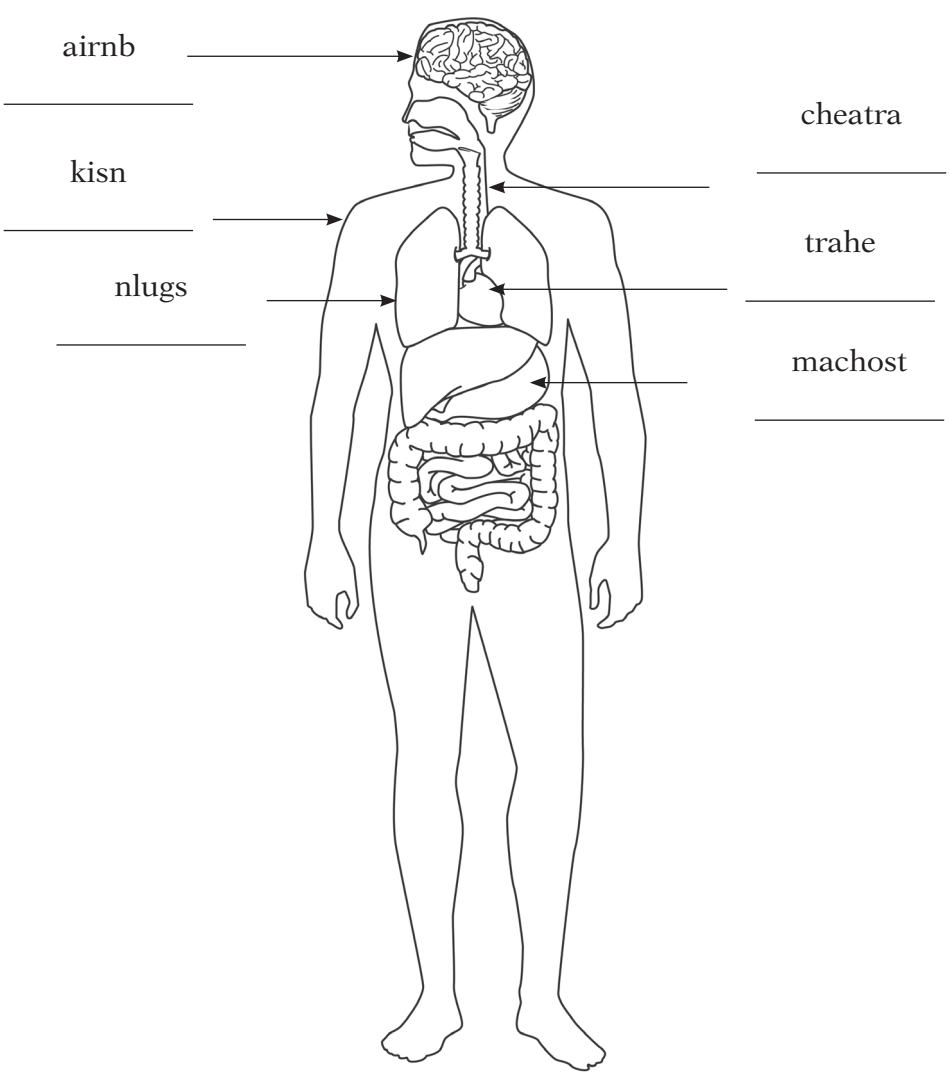

3 List three other human organs. If you can, name the system each one belongs to.

_____

_____

_____

4 Look at the diagram of the human body. Unscramble the words to identify some of the major organs.
