Body systems working together

The human body contains a number of important organs. Each organ is made up of millions of cells that have very specialised functions. For example, the heart is an organ that pumps blood around the body. Heart cells function quite differently from the cells of other organs, such as lung cells. Lung cells have special parts that help them collect oxygen for red blood cells. Lungs enable humans to breathe air in and provide the oxygen that cells need to survive. In the central nervous system, nerve cells send electric signals to another important organ – the brain. Brain cells are very delicate and control other systems in the body. The spinal cord is part of the system that involves electrical signals being passed to and from the brain.

☞ **1** Fill in the gaps in the table. The first has been done for you.

Word	**Meaning**
organ	a structure that has a special job in the body
heart	
	a pair of organs that collect oxygen
nerve cells	
	the gas humans need to keep their cells working

2 Write in the words that correctly complete each sentence.

a) In the body, the _____ works by pumping _____ around the body to all the _____.

b) In the central nervous system, _____ _____ send electric signals to the brain.

c) Our _____ work by collecting oxygen and working with the _____ blood cells to send it to all our cells.

Body systems working together CONT'D

3 Complete the table by writing in the correct letters.

One (singular)	More than one (plural)
lung	__ __ __ __ __
n __ __ __ __ c __ __ __	nerve cells
body	__ __ __ __ __ __

4 **a)** In the box below, draw the shape of a human body.

b) Mark the positions of the following organs on the body:

- lungs
- heart
- stomach
- brain
- voice box
- skin.
