Removing waste products

Our kidneys, liver, lungs and skin all help our bodies to remove waste products that aren't needed. These organs are part of a group of organs called the **excretory system**. To excrete something means to remove it from the bloodstream.

Waste products include carbon dioxide gas and certain types of body waste. Humans excrete liquid waste products through sweat and urine.

☞ **1** Read these sentences about waste products and then fill in the gaps to rewrite the information in a different order. For example, *When we digest food, waste products are made* can be rearranged and changed to *Waste products are made when we digest food*.

a) Our kidneys make urine out of our waste products and water.

Urine is made from _____ and _____ by our kidneys.

b) Sweat is waste water that comes out of our skin.

Our skin releases _____ that comes out as _____.

c) The excretory system involves different organs that help us remove waste from the body.

The different organs that help us remove waste from the body are part of the _____ _____.

2 Complete the following sentences by filling in the missing vowels (a, e, i, o, u).

a) The waste product c__rb__n d__ __x__d__ leaves the human body every time a person exhales, or br__ __th__s __ __t through their l__ngs.

b) The l__v__r changes toxic ammonia in the blood to the waste product urea. The k__dn__ys filter the urea from the blood and turn it into __r__n__.

c) Waste products are removed through sw__ __ t, which comes out tiny openings in the sk__n, called p__r__s.
