What else are bodies made of?

Animals and humans are made of cells, which make up tissues, which make up organs, which work together in groups to make up body systems. The bodies of humans and some other animals are built around a structure called a **skeleton**. We call all the bones and joints in the body the **skeletal system**. The bones of our bodies help us stay upright and give us proper shape and strength. Plants do not need skeletons because they have hard cell walls, which give their tissues a solid frame.

Attached to the human skeleton are **muscles**. Muscles allow us to move. Muscles are attached to bones by tissues called **tendons**. Muscles work together to push and pull on our bones, giving us the ability to move. When a muscle pulls, we say it contracts. When the muscle stops pulling, we say it is relaxed. Bones are joined together at places in the body called joints. Knees and elbows are examples of joints. Inside our joints, strings called **ligaments** tie the bones together.

☞ **1** Read the text below. Circle any words that you think are spelled incorrectly.

We call all the bones and joynts in the body the sceletal system. Mussels are attached to bones by tendins. Muscles work together, often in pears – for example, the biceps and triceps in the arm. When the biceps muscle contracts, the triceps muscle relaxes and the elbow bends. When the triceps contracts, the biceps relaxes and the arm stratens.

2 Rewrite correctly the words that you circled in Question 1.
