Do plants breathe?

Plants take in air, like humans do, although we don't call it 'breathing'. Most plants have leaves, which are made up of layers of cells. In the leaves are tiny holes. These holes can open and close to let gases in and out. Plants do this during two processes: **photosynthesis** and **respiration**. Plants respire all the time, but they only photosynthesise in sunlight.

Word bank

dioxon carbide

muhans

oselugc

gyoxen

☞ **1** Unscramble the words in the word bank and then write them in the answer spaces to complete this passage about photosynthesis.

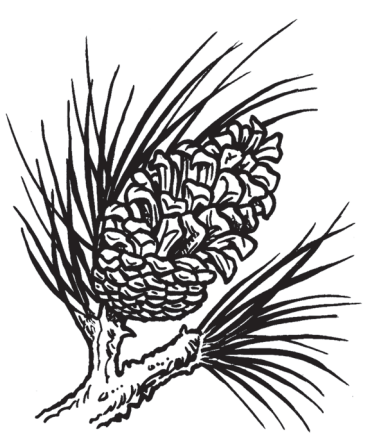

Plants take in _____ gas and release oxygen gas. Carbon dioxide is the gas that _____ and animals breathe out. Plants use this gas, along with water and sunlight, to produce the food _____. A side product of this process is _____ – the most important gas in the air for humans. This process is called photosynthesis. The word equation for this is:

carbon dioxide + water (+ light energy) = glucose + oxygen

2 Fill in the vowels (a, e, i, o, u) to complete this passage about respiration.

Like animal cells, plant cells need __xyg__n to survive. The plant cells need __xyg__n to help them release energy from gl__c__s__. The plant takes in __xyg__n and releases c__rb__n d__ __x__d__ as a waste product. This process is called respiration. The word equation for this is:

glucose + oxygen = carbon dioxide + water (+ energy)
