Inside plant cells

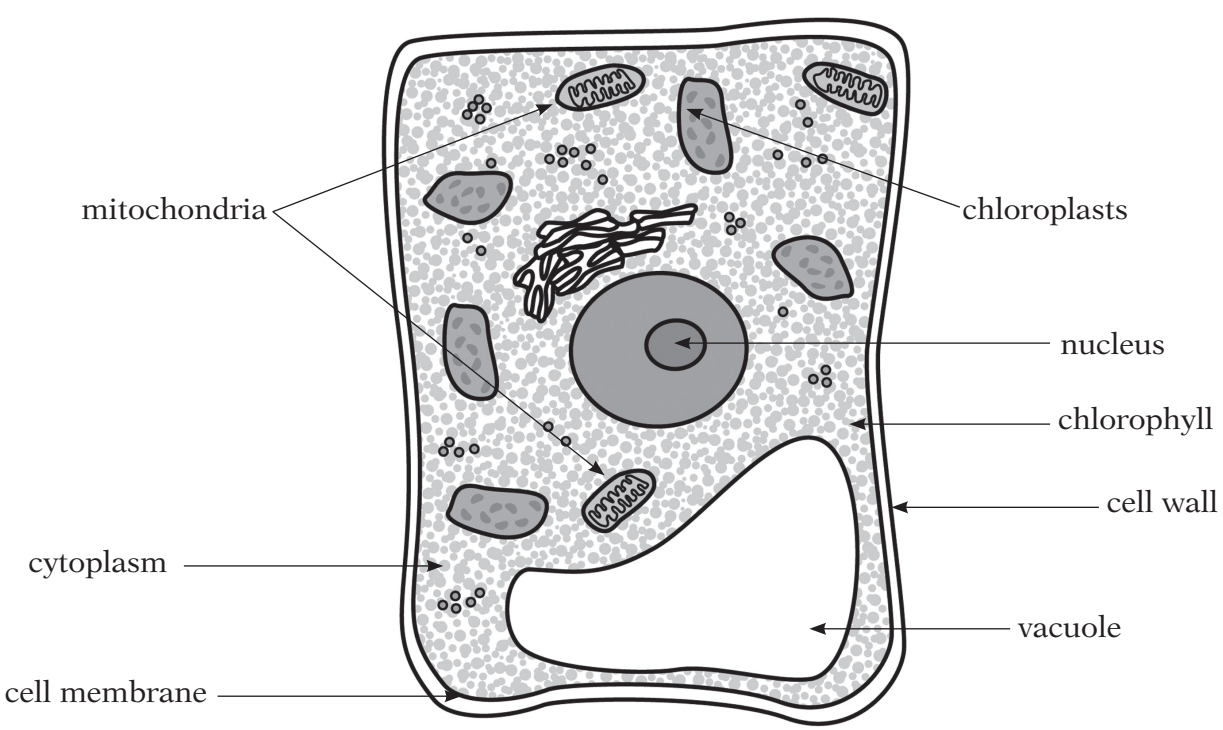

BACKGROUND

organelles (say 'or-gan-elles') – tiny living machines that are found inside cells

☞ **1** Complete the following passages by filling in the missing vowels (a, e, i, o, u).
Hint: The labels on the diagram will help you.

Plant cells have a c__ll m__mbr__n__ that is soft. This m__mbr__n__ is surrounded by a protective layer called the c__ll w__ll. The c__ll w__ll is made of a substance called cellulose. It is what gives plants their rigid form and shape.

The parts of a plant cell are floating in a jelly-like substance called cyt__pl__sm. A plant cell has a n__cl__ __s, which controls the cell. Also inside the cell are organelles called chl__r__pl__sts. These contain chl__r__phyll, a green substance that plants use to make their food. There are m__t__ch__ndr__ __ too, which are organelles that help provide the cell with energy. There are also areas called v__c__ __les, which store water inside the cell.

2 In your own words, write descriptions of each of these parts of plant cells.
Use complete sentences.

a) cell membrane
