Genetics – definitions

Use words from this list to identify the terms.

ALLELES	CHARACTERISTIC	CHROMOSOMES	CLONING	CO-DOMINANCE	
DIPLOID	DOMINANT	DOUBLE HELIX	EMBRYOLOGY	FERTILISATION	GAMETE
GENETIC ENGINEERING	HETEROZYGOUS	INHERITANCE	MEIOSIS	MUTATION	
NUCLEOTIDE	HYBRID	PEDIGREE	POLYPEPTIDE	PUNNETT	RESOURCES
EVOLUTION	REPLICATION	SUTTON	TRANSGENIC		

1 Change of organisms over time. _____

2 Used by organisms to maintain life. _____

3 The study of developing embryos of different species. _____

4 Distinguishing feature of an organism. _____

5 Process by which we receive characteristics from an ancestor. _____

6 Having different alleles for a given trait. _____

7 A pair (or more) of genes that determine a specific characteristic. _____

8 Genes that will be expressed in a phenotype. _____

9 Table showing family tree. _____

10 Humans have 23 pairs of these – contain genetic information. _____

11 The symbol (2n) means two chromosomes (paired). The word for 2n is: _____

12 Cell division that produces sex cells. _____

13 Sex cell. _____

14 When male and female sex cells fuse. _____

15 Neither completely dominant nor completely recessive. _____

16 Building block that makes up DNA strand. _____

17 Contains two or more amino acids. _____

18 Sudden change in DNA. _____

19 Technique used to alter the genetic makeup of an organism. _____

20 Asexual reproduction resulting in genetically identical organisms. _____

21 Organism that has received genetic material from a different species. _____

22 Along with Boveri, identified the importance of chromosomes in inheritance. _____

23 Model of DNA proposed by Crick, Franklin and Watson. _____

24 Squares used to predict inheritance of phenotypes and genotypes. _____

25 Process of duplicating the genetic material within a nucleus. _____

26 Produced when the genetic material of two species is mixed. _____
