6

Methods of contraception

Contraception is the deliberate prevention of conception or impregnation, ie stopping a female from becoming pregnant. There are many means of contraception. The boxes below contain the names of methods of contraception and details of how they work. Cut out the boxes and divide them into two groups: 'Type of contraception' and 'Method of action'. Match up each type of contraception with its method of action.

1 Cap or diaphragm	**10** Rhythm method
2 Observing changes in vaginal mucus to determine time of ova release.	**11** Plastic or metal item placed in uterus, which prevents implantation of zygote.
3 Vasectomy in males and tubular ligation in females.	**12** Fitted in the uterus to prevent sperm from passing into the oviduct.
4 Male withdraws penis from vagina before ejaculation.	**13** Worn by male to prevent discharge of semen in vagina.
5 The 'pill'	**14** Ovulation
6 Condom ('sheath')	**15** Intra uterine device (IUD)
7 Foam or jelly placed in vagina, which destroys sperm.	**16** Abstaining from sexual intercourse around the time of ovulation.
8 Coitus interruptus ('withdrawal')	**17** Prevents ovulation by keeping a high level of oestrogen and progesterone.
9 Sterilisation	**18** Spermicide
