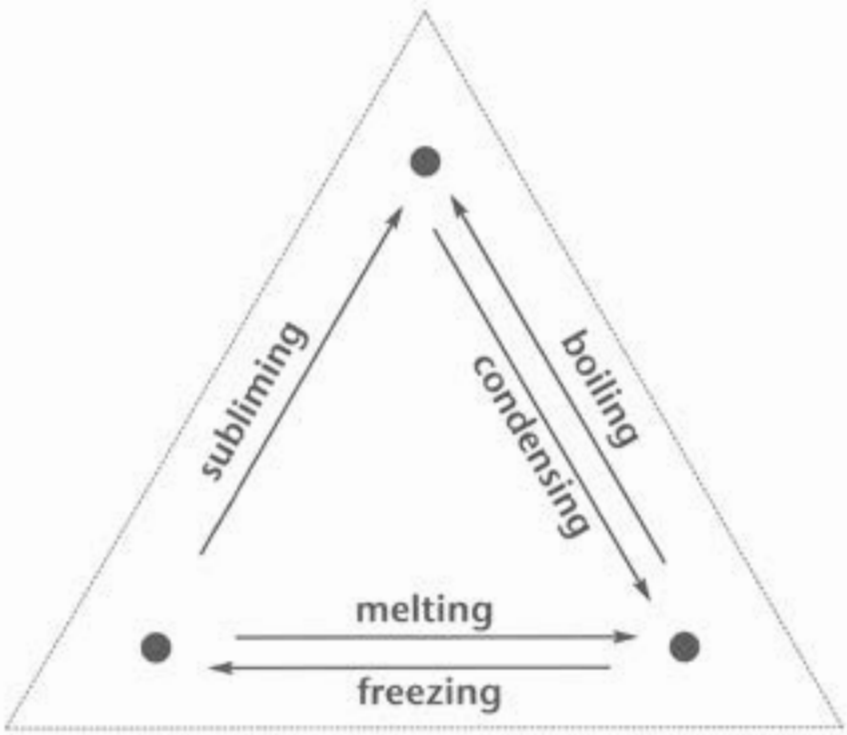
THE THREE STATES OF MATTER 2

Matter is anything that has mass and takes up space. Matter can exist in three states or phases: solids, liquids and gases.

1 Cut out the headings and descriptions below. Arrange each description under the appropriate heading and then glue them in place.

Solids	Liquids	Gases
Have no fixed shape; take the shape of their containers	Have no fixed shape; take the shape of their container	Have no fixed volume; occupy the volume of their container
Have a fixed shape	Are much less dense than solids or liquids	Are difficult to compress and have a fixed volume
Are usually the most dense state	Are almost as dense as their solid phase	Have a fixed volume

2 Matter can change its state. The triangle below shows changes of state. Cut out the triangle and the labels. Put each label at the correct corner of the triangle. Glue the labels in place.



Solid
Liquid
Gas
