Genetic Terms

8

Match each term with its correct definition/description by writing the letter corresponding to the description in the blank box next to the word it describes.

	Term			Description
1	allele		a	Name for the normal number of chromosomes in a (non-sex) cell.
2	asexual		b	Variations on a gene for a particular characteristic.
3	cell		c	Genetic make-up of an individual.
4	characteristic		d	Progeny (children) of a plant or animal.
5	chromosome		e	Reproduction involving male and female.
6	diploid		f	A group of similar organisms capable of interbreeding.
7	dominant		g	Thread-like structure consisting of DNA, found in a cell's nucleus.
8	gamete		h	Characteristic masked by a dominant one.
9	generation		i	Name for cells only having half the 'normal' number of chromosomes.
10	genetics		j	Male sex cell.
11	genotype		k	Coworker with Crick, involved in DNA research.
12	haploid		l	The result of a sperm fertilising an ovum.
13	heterozygous		m	Offspring of the same set of parents.
14	homozygous		n	Process by which organisms produce offspring.
15	meiosis		o	Having the same alleles for a particular characteristic.
16	Mendel		p	Sudden change in DNA causing genetic variation.
17	mitosis		q	Reproductive germ or sex cell.
18	mutation		r	How sex cells reproduce.
19	offspring		s	How most cells reproduce.
20	recessive		t	His laws of inheritance are the basis for modern genetics.
21	reproduction		u	Study of heredity or passing on of characteristics.
22	sexual		v	Feature passed on to offspring, such as eye colour.
23	species		w	Having two kinds of allele for a particular characteristic.
24	sperm		x	The characteristic always seen in the offspring.
25	Watson		y	Basic unit of all living creatures.
26	zygote		z	Reproduction that doesn't involve sex.
