More Genetic Terms

58

Match the term with the correct definition/description by putting the letter of the individual description in the box next to the word it describes.

	Term			Description
1	centriole		a	Ordered displays of an individual's chromosomes.
2	chromosome		b	Regions of centromeres where microtubules attach.
3	chromatids		c	Two bodies just outside the nucleus, vital to cell division.
4	chromatin		d	The location on a chromosome of a gene or allele.
5	cytokinesis		e	A change in hereditary material.
6	cytoplasm		f	Body which carries the coded, hereditary information.
7	DNA		g	The cell's control centre.
8	F_1/F_2		h	Total number of individuals of the same species in a location.
9	Hardy		i	Produces no effect when present with a contrasting allele.
10	homologous		j	Connected with Weinberg in a law concerning heritance.
11	karyotype		k	For example male parent first cross and female parent second cross, etc.
12	kinetochore		l	Making copies.
13	locus		m	Connected specifically to either the X or the Y chromosome.
14	mutation		n	Fibre network along which chromosomes arrange in division.
15	nucleus		o	The cytoplasm cleaving into two daughter cells.
16	population		p	Final stage of mitosis, the spindle disappears.
17	recessive		q	An inherited characteristic.
18	reciprocal		r	To do with the body.
19	replication		s	Phenotype most common in natural populations.
20	selective		t	Cell's material where chemical reactions vital to life occur.
21	sex linkage		u	Choosing or being specific.
22	somatic		v	Having the same alleles for a characteristic.
23	spindle		w	Nucleic acid that is the basis of hereditary.
24	telophase		x	Thread-like mass of nucleic acids and basic proteins.
25	trait		y	First and second generations.
26	wild type		z	Joined, parallel strands of duplicated chromosome.
