Spheres of the earth 3

1 The earth can be divided into layers, each with particular features.

a Use the root words and their translations to join the names of the layers with the correct meanings in the table below.

b Then join each meaning to the corresponding thickness of the layer.

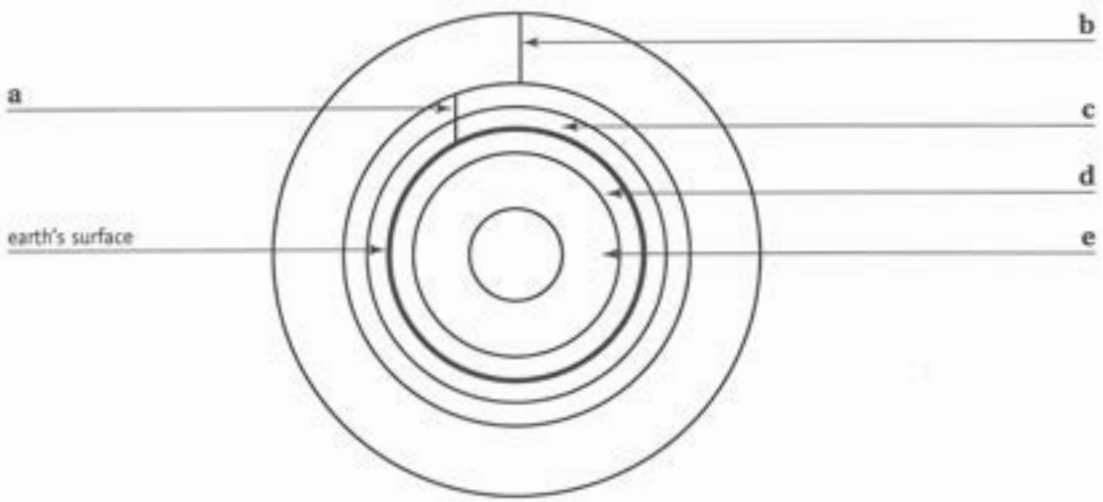
Root words:

Lithos (Gk) = stone Sphera (Ln) = ball, globe Atmos (Gk) = vapour Bios (Gk) = life

Hydor (Gk) = water Sphaira (Gk) = ball asthenes (Gk) = weak, soft

Layer name	Meaning	Thickness
1 Asthenosphere	A Narrow ring of living things	i 0 – 5 km
2 Atmosphere	B Sphere of solid rock, varying thickness	ii 10 km
3 Biosphere	C Thick ring of gases	iii 5 – 60 km
4 Hydrosphere	D Thick layer of liquid rock	iv 100 km
5 Lithosphere	E Thin ring of water, varying thickness	v 100 km

2 Label the diagram of the earth with the layer names from the table.



3 Complete the table below. List the names of the spheres in the first column, 'Sphere name'. In the other two columns, think of two things that are commonly found in each sphere and write them into the table.

Sphere name	Example 1	Example 2
