...is the main female reproductive hormone produced in the ovaries.	**START:** Approximately every 28 days...	...an egg is released.	Follicle stimulating hormone (FSH) causes...
...maturation of an egg in the ovary prior to ovulation.	Disadvantages of IVF treatment are that it is...	...very emotionally and physically stressful and the success rates are not high.	Thyroxine stimulates...
...the basal metabolic rate and plays an important role in growth and development.	Ovulation is...	...the release of an egg from the ovary into the fallopian tube.	The blood carries hormones to target organs where...
...they produce an effect.	Oral contraceptives that contain oestrogen and progesterone work by...	...inhibiting the production of FSH so that no eggs mature in the ovary.	Testosterone stimulates...
...sperm production in the testes.	Luteinising hormone (LH) stimulates...	...the release of the egg from the ovary into the fallopian tube.	The only type of contraception that protects against sexually transmitted diseases is...
...a condom.	The two hormones involved in maintaining the uterus lining are...	...oestrogen and progesterone.	Testosterone is the main male reproductive hormone and is produced by...
...the testes.	Fertility can be controlled by...	...a variety of hormonal and non-hormonal methods of contraception.	Fertilisation is...
...the fusion of an egg and a sperm as the result of sexual intercourse or IVF treatment.	Slow release progesterone in an injection or implant work by...	...inhibiting the maturation and release of eggs for months or years.	Adrenaline prepares the body for 'flight or fight' by...

…increasing heart rate and boosting delivery of oxygen and glucose to the brain and muscles.	Thyroxine levels are controlled by…	…negative feedback.	The endocrine system is composed of…
…glands which secrete chemicals called hormones directly into the bloodstream.	Compared to the nervous system the effects of the endocrine system are…	…slower but act for longer.	Thyroxine is produced by…
…the thyroid gland.	Insulin is produced by …	… the pancreas when blood glucose concentration is too high.	Adrenaline is produced by…
… the adrenal glands in times of fear or stress.	The disorder caused when the pancreas cannot produce enough insulin …	… is called Type 1 diabetes.	If a woman is struggling to conceive a baby she may be given a ‘fertility drug’ containing …
… FSH and LH, which stimulate egg maturation and ovulation.	A diaphragm may be used with a spermicidal agent which…	…kills or disables sperm.	A fertilised egg is called….
…a zygote.	The disorder caused when the body cells don’t respond to insulin …	…is called Type 2 diabetes.	Type 2 diabetes can be treated by …
… controlling carbohydrate in the diet and exercise.	Barrier methods of contraception such as condoms and diaphragms…	…prevent pregnancy by preventing the sperm reaching an egg.	Type 1 diabetes can be treated by …
… regular insulin injections.	The pituitary gland is a ‘master gland’ because it …	… secretes several hormones that cause other glands to release other hormones.	Oestrogen…

Teaching notes

There are 32 cards, allowing it to be used with a whole class. The activity could also be done individually, in pairs or in small groups to produce a complete ordered set of cards.
