Teaching notes

This learning grid has been adapted from an idea from the book *Outstanding Teaching: Engaging Learners* (Crown House Publishing) by Andy Griffith and Mark Burns (2012).

This resource is designed for revision of OCR GCSE Gateway Science Biology module B2, 'Understanding our environment', but can easily be adapted for other specifications.

Equipment needed by each group

- 2 dice
- learning grid
- set of keyword cards, placed face down
- pencils and paper
- play dough

Instructions

Students can play in pairs or groups of four.
Students roll a dice twice to get a grid reference.

They take it in turns to link the image to a keyword or explain the keyword.

The activity can be differentiated by asking students to:

A. Give three key points related to the square.
B. Make links between their square and another.
C. Talk for a minute on the keyword/image.

Alternatively on their first go they could give A answers, on their second go they do B etc.
Or the teacher could allow 5 minutes when everyone gives A answers. Then using the Teachit timer they could get everyone to swap to B and then change to C a few minutes later.

When students land on one of the following squares they take a keyword from the pile.

	Students act out a keyword for the others to guess.
	Students make up a question for the others to answer which involves the keyword in the question or answer.

Quick draw	Students take a keyword from the pile and then draw it for the others to guess.
Model it	Students take a keyword from the pile and use play dough to model it for the others to guess.

Keyword cards

lichen	sulphur dioxide	variation
biodiversity	habitat	mimicry
species	arthropod	Linnaeus
producers	secondary consumers	pyramid of biomass
carbon dioxide	decomposers	root nodules
acid rain	behavioural adaptation	Wallace
extinction	seed banks	sustainability
counter-current heat exchange	population	phylum
hybrids	evolution	natural classification
artificial classification	evolutionary tree	denitrifying bacteria

	1	2	3	4	5	6
1	energy transfer	?	classification	N2	food web	carbon sinks
2		trophic levels	mutualism	indicator species	Model it	conservation
3		Darwin and Lamarck	Quick draw	?	competition	hybrids
4		MRSA	generalists	legumes		
5	niche	ozone layer			predator/ prey relationship	
6	?	photosynthesis and respiration		extremophile		natural selection
