Task

Complete the table to summarise which hormones each endocrine gland secretes and their function.

Colour in the rows different colours according to whether they are found in both males and females, just female or just male.

Gland	Hormone	Target organs	Effect
thyroid gland			
	adrenalin		
ovary	oestrogen	ovaries, uterus, pituitary gland	
	progesterone		
	insulin		
pituitary gland	anti-diuretic hormone (ADH)		
pituitary gland			
	luteinising hormone (LH)		
	testosterone

Answers

Gland	Hormone	Target organs	Effect
thyroid gland	thyroxine	liver and kidneys	Stimulates the basal metabolic rate. It plays an important role in growth and development.
adrenal gland	adrenalin	vital organs, e.g. liver and heart	Produced in times of fear or stress. Increases heart rate and boosts delivery of oxygen and glucose to the brain and muscles, preparing the body for ‘flight or fight’.
ovary	oestrogen	ovaries, uterus, pituitary gland	Controls puberty and the menstrual cycle in females; stimulates production of LH and suppresses the production of FSH in the pituitary gland.
ovary	progesterone	uterus	Maintains the lining of the womb - suppresses FSH production in the pituitary gland.
pancreas	insulin	liver	Controls blood sugar levels.
pituitary gland	anti-diuretic hormone (ADH)	kidney	Controls blood water level by triggering uptake of water in kidneys.
pituitary gland	follicle stimulating hormone (FSH)	ovaries	Triggers egg ripening and oestrogen production in ovaries.
pituitary gland	luteinising hormone (LH)	ovaries	Triggers egg release and progesterone production in ovaries.
testes	testosterone	male reproductive organs	Controls puberty in males.
