Worksheet 9.2

Igneous rocks

Answers

1. (a) The figure below left shows a region of past igneous activity. Igneous rocks are found in the two locations marked by arrows. Label these rocks as either intrusive igneous rocks or extrusive igneous rocks.

(b) The photos below show sections of rocks taken from these sites. Section A is coarse grained, and section B is fine grained. Identify which rock is intrusive and which extrusive.

Section A
Intrusive

Section B
Extrusive

2. Read the information about various igneous rocks and create a written classification key to distinguish them.

Scoria

Pumice

Granite

Pumice: pale coloured rock; very light; very porous; many small gas holes

Scoria: red-brown or grey rock; light but heavier than pumice; porous; small and large holes

Obsidian: smooth, glassy black rock; non-crystalline

Granite: hard; dense; large crystals; speckled colours (white, black, glassy, pink)

Basalt: grey or black rock; very fine crystals; hard; dense

Key:

1A. Rock is porous.....**go to 2**

1B. Rock is not porous.....**go to 3**

2A. Rock is pale in colour and very light.....**pumice**

2B. Rock is red or grey.....**scoria**

3A. Rock is smooth, black and glassy.....**obsidian**

3B. Rock is not smooth, black and glassy.....**go to 4**

4A. Rock is speckled with large crystals.....**granite**

4B. Rock is grey or black with fine, dense crystals.....**basalt**
