Cycles in nature

Student: ..... Class: .....

The nitrogen cycle

1. The following diagram summarises the nitrogen cycle in nature.

The nitrogen cycle

(a) Explain why nitrogen is such an important chemical in nature.

(b) Identify two decomposers at point X.

(c) Identify the ways that ammonia can enter the soil.

(d) Explain why ammonia does not build up in the soil.

.....

.....

The recyclers

2. Matter and energy are recycled in nature. The nitrogen cycle, carbon cycle and water cycle are very important systems. These cycles involve living things as well as non-living things.

(a) Maggots

(b) Bacteria

(c) Fungi

Photos:
Maggots: Dario Lo Presti / 123RF
Bacteria: dtkutoo / 123RF
Fungi: jarous / 123RF

Explain the role of each of the decomposers shown in terms of recycling matter.
