Worksheet 5.8

Chemical reactions: Summary

Student: ..... Class: .....

Complete the statements below to compile a summary of this unit. The missing words can be found in the word list below. Some of the words may be used twice.

1. In a chemical reaction, the atoms of the ……. are rearranged and new bonds are formed. In this way, new chemicals, the ……., are formed.
2. The Law of Conservation of Mass states that matter can be neither ……. nor ……. during a chemical reaction.
3. It is important to know the correct ……. of the reactants and products when writing a balanced chemical equation.
4. An ……. solution is one in which a substance is dissolved in water.
5. When two aqueous solutions react, a solid ……. sometimes appears.
6. All compounds containing the sodium ion, the ammonium ion, the ……. ion and the ……. ion will dissolve in water.
7. Redox reactions involve the ……. of electrons from one atom, ion or molecule to another.
8. Redox reactions are actually two reactions, ……. and ……., happening simultaneously.
9. In the 'dry' ……. of metal, electrons are transferred from metal atoms to oxygen molecules.
10. A ……. reaction occurs when one element displaces another element from a compound.
11. Hydrocarbons are chemicals that contain only ……. and ……..
12. When one compound breaks down into two or more simpler chemicals, a ……. reaction has occurred.
13. Magnesium reacts readily with acid, but gold does not. This is due to the different ……. of the metals.
14. When metals are reacted with hydrochloric acid, ……. gas is produced.
15. A ……. is produced when an acid and a base react together in a neutralisation reaction.
16. A base containing the carbonate ion will produce ……. ……. as well as a salt and water when it reacts with an acid.
17. A ……. is a substance that speeds up a chemical reaction without reacting in the reaction.
18. Amylase is an example of a biological catalyst or ……..
19. The production of light by a chemical reaction is called ……..

transfer	dioxide	potassium	enzyme
formulae	catalyst	salt	oxidation
products	hydrogen	carbon	reactivity
precipitate	reactants	created	corrosion
displacement	destroyed	decomposition	nitrate
reduction	aqueous	electrons	chemiluminescence
