Worksheet 4.4

Breathing — constructing a report

Answers

Use the information in your textbook together with other information from the internet and library to complete a scaffold about the topic ‘Breathing’.

Use the completed scaffold to write a final report using a word processing application. Include labelled diagrams to show the processes of inhalation and exhalation.

Title: Breathing
Heading: Introduction Make general statements about: ● the name and location of the respiratory organs in the body lungs (in chest cavity); trachea (links nasal cavity to lung bronchi); bronchi (tubes leading into lungs); diaphragm (muscle to change volume of chest cavity) ● the differences between inhalation and exhalation. Inhalation: breathing in (richer in oxygen/poorer in carbon dioxide) Exhaling: breathing out (less rich in oxygen/increased amounts of carbon dioxide)
Heading: Structure of the respiratory system Record information about: ● lungs Two lungs; composed of many alveoli ● bronchi Two tubes; divides into smaller tubes called bronchioles ● trachea Tube that takes air from nasal cavity down into the bronchi. Wall has cartilage for strength. ● diaphragm. Muscular tissue that separates chest from abdomen. Contracts and expands and adjusts air pressure inside chest cavity. Works with lungs to help move air in and out
Heading: Alveoli and blood capillaries Record information about: ● the structure of alveoli Small air sacs (resemble bunches of grapes) at the ends of small bronchioles ● the connection between alveoli and blood capillaries. The surface of each alveolus is covered with capillaries so that gases can be exchanged quickly with the bloodstream.
Heading: Conclusion Make a statement about the importance of inhalation and exhalation to the health of the body. Inhalation brings fresh air and oxygen into the body and exhalation removes carbon dioxide waste. If either system is unhealthy due to smoking or disease, then the process is less efficient and affects the health of the whole body.
