Drawing Tables for Data

You will need to construct a table to collect the data obtained in an experiment.

What your table needs.

The Effect the Mass of Cargo Carried by a Truck has on the Speed of the Truck

Mass of cargo in Truck (Kg)	Maximum Speed of Truck (Km/h)
100	100
200	100
300	95
400	90
500	85
600	80
700	75

What is wrong with this collection of raw data below?

10 km = 30g
20km =40g
30000m=5000000g
40km is 60k8

Look at the following data and put it into a suitable table. The amount of fuel used by a car driving up hills of different angle was recorded. When the car drove up a hill of 5^0 angle it used 1 litre of fuel to travel 1km. When the same car drove up a hill of 10^0angle it took 1.2 litres of fuel to travel 1 km. When the same car drove up a hill of 15^0 angle it took 1.4 litres to travel 1 km.

Ball Bounce Activity

Your activity is to compare how high 4 different balls bounce when dropped from 1 metre in height. You will compare golf balls, tennis balls, squash balls and table tennis balls.

Aim: to find which ball bounces highest when dropped from one Metre.

Hypothesis: The tennis ball will bounce the highest when dropped from one metre.

Independent variable (The thing that is changed): The type of Ball.

Dependent variable (the thing that happens as a result of the independent variable that we measure): Bounce height.

Controlled variables. Things we need to keep the same. All balls dropped from one metre. All balls land on the same surface. Method of measuring bounce height. Temperature of the balls. Temperature of the day.

Equipment (what you will need): a tennis ball, a golf ball, a table tennis ball, a squash ball and a metre ruler.

Procedure (what you need to do):

Stand a one metre ruler up so that the zero end is on the floor.

You will need at least 3 people. One to drop the ball, one to crouch down and watch for the rebound height and one to record the Data.

From the 100cm mark one person will drop the golf ball.

The crouching person records how far up the ball bounces back up once it has hit the floor.

The recorder write this down.

Repeat this another 2 times for the golf ball so that you get 3 results (trials)

Now do all this for the squash ball, tennis ball and table tennis ball.

Results

Raw data table

Ball type					

Conclusion:
