Investigating melting times

Aim: To determine whether oil or water melts the fastest

Hypothesis: _____(leave space)_____

Equipment:

- 2 small beaker
- Warm water (from tap)
- One ice cube (coloured)
- One oil cube
- Thermometer
- Stopwatch

Method:

1. Fill each beaker half full with warm water
2. Record the starting temperature of the water
3. Put one cube in each beaker and start timer
4. Record temperature and observations every minute

Results:

Oil:

Time (min)	0	1	2	3	4	5
Temperature						
Observations						

Water:

Time (min)	0	1	2	3	4	5
Temperature						
Observations						

Conclusion:

My hypothesis was _____(supported or not supported) because……..

Extension questions:

1. What were the independent, dependent and control variables?
2. What could you have controlled better to make this a more fair test?
3. What is the word that describes how the colour particles moved around? d_____
4. Why did the oil create a film above the water?
5. Which absorbed more heat – the oil or water?
