RESPIRATORY SYSTEM Name: _____

Respiration is the breakdown of sugar in oxygen to give energy.

Breathing brings **oxygen** from the air into our blood.

We use our respiratory system to breathe.

Glucose + _____ ➔ Carbon Dioxide + _____ + Energy

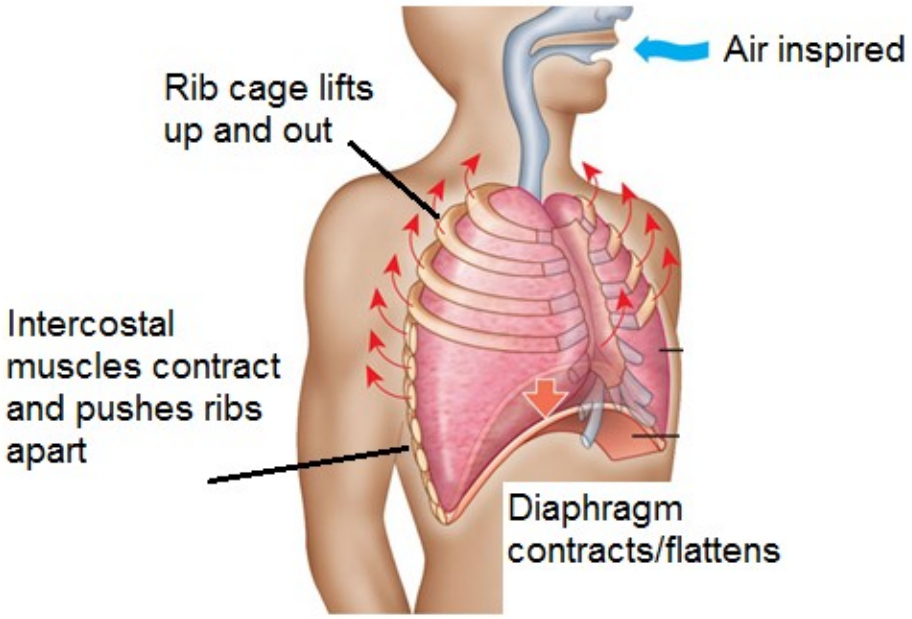

♦ Air comes in through the _____ passage.

♦ The air then moves through the pharynx (throat) and then the larynx (voice _____).

♦ The air moves through the _____. This has rings of cartilage to stop it from collapsing in on itself.

♦ The trachea branch into two _____. These then branch off into even smaller branches called _____. At the end of these small branches are tiny bubbles of air called _____.

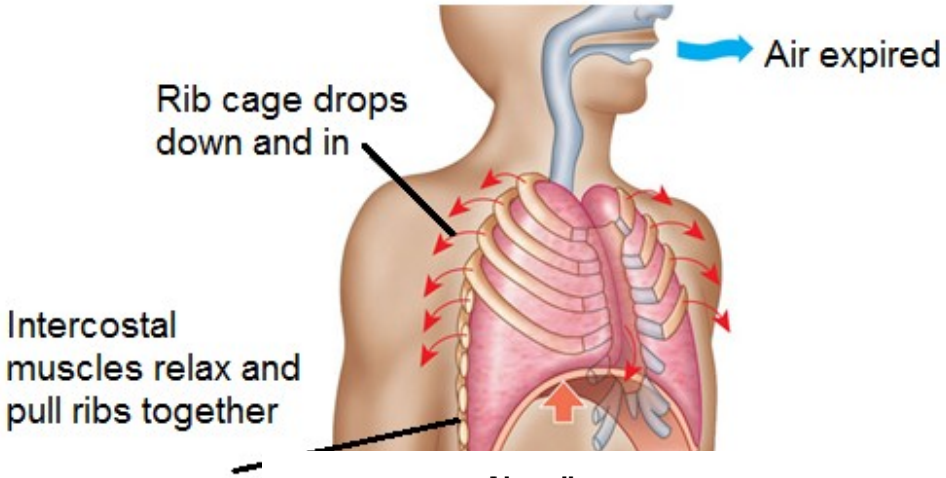

Inspiration (inhalation)

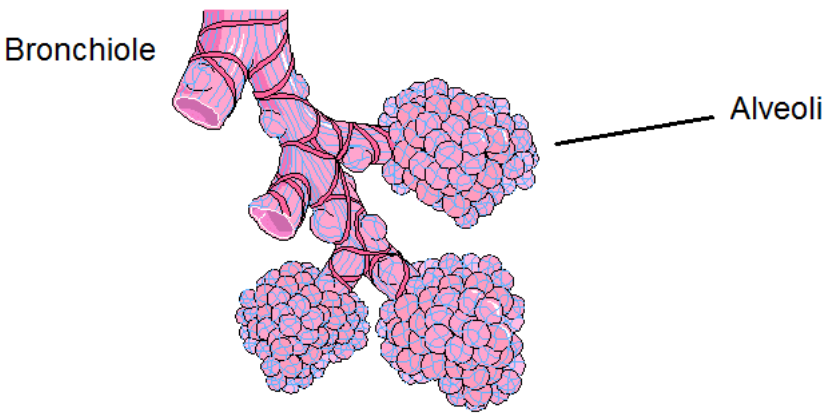

Volume of lungs: _____

Pressure in lungs: _____

Expiration (exhalation)

Alveoli -
site of gas exchange

Volume

Pressure

GAS EXCHANGE

♦ This occurs in the **alveoli** of the lungs.

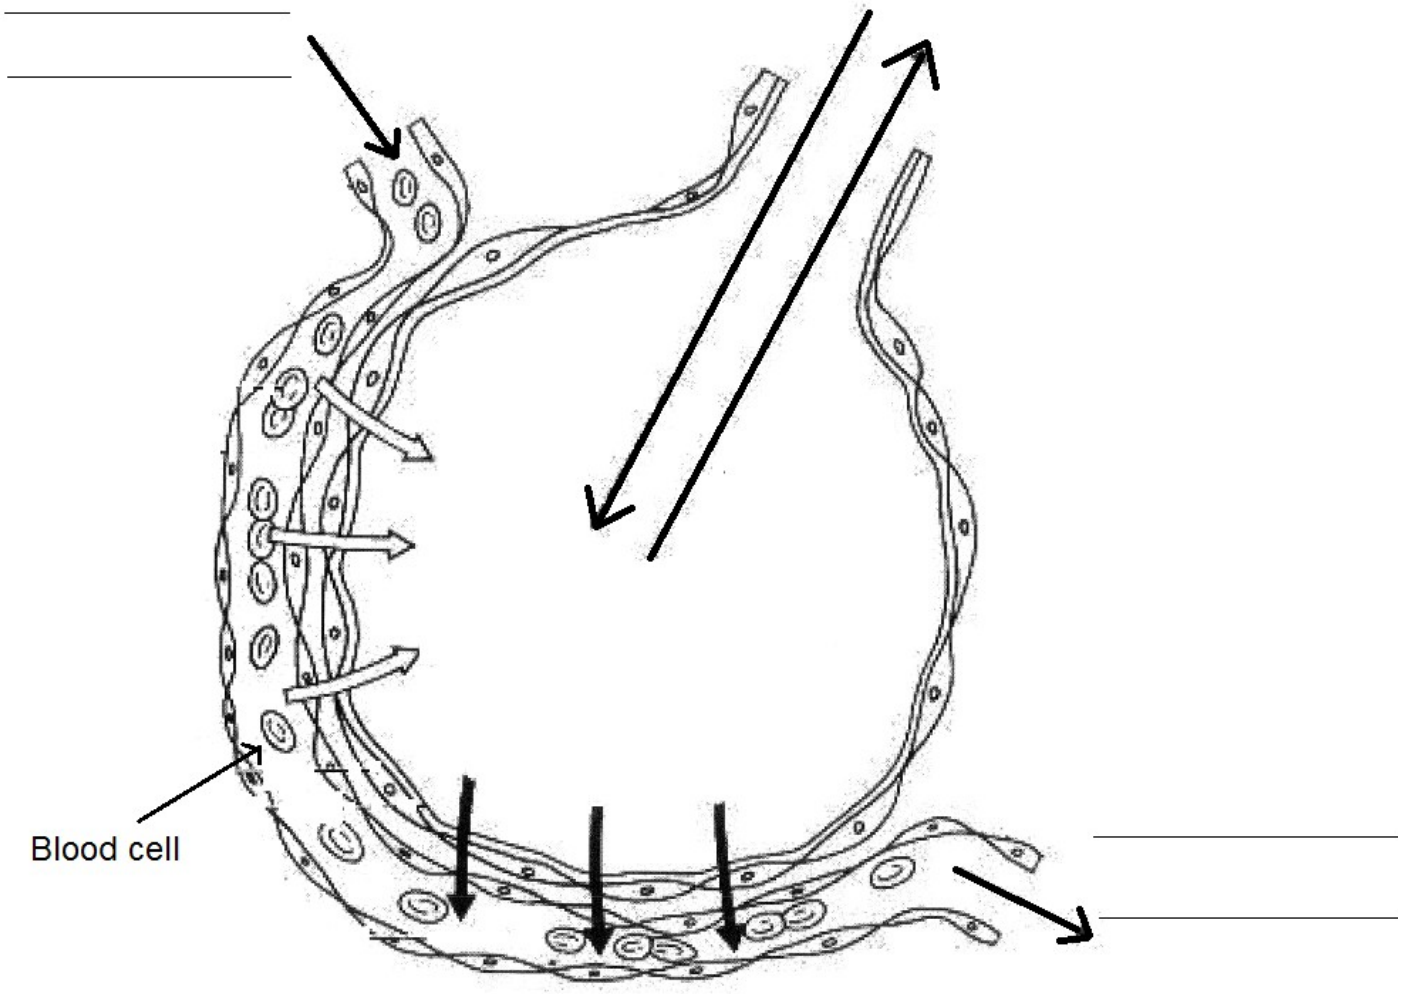

♦ **Oxygen** in the alveoli is exchanged for **carbon dioxide** in the blood.

♦Air that has been inspired has a higher concentration of oxygen and a lower concentration of carbon dioxide.

♦ Blood which has travelled around the _____ has used up the oxygen so there is a _____ concentration of oxygen and a higher concentration of carbon dioxide.

♦ The blood that moves through the capillaries and around the alveoli collects oxygen and it is taken to the rest of the body.

♦ These gases are exchanged through a process called **diffusion**.

RESUCITATION

♦ Breathing into the _____ or nose of the patient to keep up the _____supply to their cells.

EXCRETION

♦ Wastes are removed from your body through sweating, urinating, _____ out and defecation (doing a number 2).

♦ The process of removing _____ from the body is called **excretion**.

♦ **Urination**

♦ Your body has _____ kidneys.

♦ The waste from your body cells is carried in the blood to your kidneys which then filter the blood and remove the wastes.

♦ Each kidney is about _____ centimetres long and contains many microscopic structures called _____.

♦ Wastes such as urea, _____ and excess water (extra water that your body doesn't need) are removed.

♦ The waste leave the kidneys through two tubes called _____.

♦ It is then stored in the bladder. The liquid is now called _____.

♦ When the bladder becomes full, the liquid leaves the body through a tube called the urethra and urination has occurred.

♦ **Sweating** has two main functions.

- It helps to control your body _____.
- It removes waste water containing _____.

♦ **Defecation** is when undigested food and dead blood cells leave your body through the anus. This waste is called f_____.
