Accurate

Accurate means measuring something as exactly as you can.

☞ Below you will find different pieces of apparatus, which may be used to measure materials for an experiment. Put a circle around the correct apparatus for each experiment provided. Then look at the equipment which is leftover. What might each be used to measure?

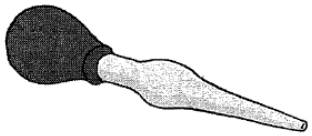

1. Which one of these would you use to measure exactly 20ml of copper sulphate solution?

Beaker

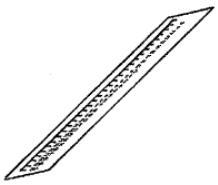

Measuring cylinder

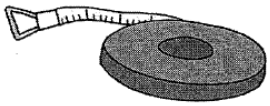

Pipette

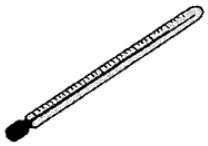

2. What would you use to measure 5cm of magnesium ribbon?

Ruler

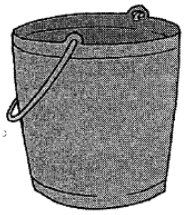

50 metre tape

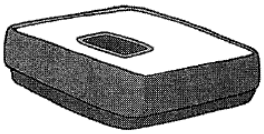

Thermometer

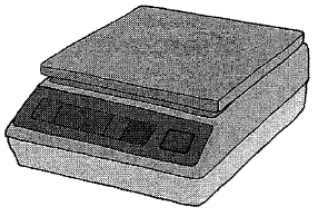

3. What would you use to measure exactly 25gm of sugar?

Bucket

Bathroom scales

Electronic scales

Fair

A **fair** test is when you only change one thing at a time.

☞ John wanted to see how far a ball would bounce when he dropped it. This is how he carried out his experiment.

1. For his first experiment he held the ball above his head when he dropped it.
2. He repeated the experiment but this time he threw the ball up into the air before it bounced on the ground.
3. For his third attempt John borrowed his friend's ball and threw it against the wall to see how far it would bounce back.

☞ How fair was John's test? Answer these questions.

1. Was this a fair way to find out how far a ball would bounce when it was dropped?

   _____

2. Make a list of all the things that John changed during his three experiments.

- _____
- _____
- _____

☞ What things would you have kept the same in this experiment?

- _____
- _____
- _____

☞ What one thing would you have changed?

_____
