# Chapter 8 Rocks

## EXTRA WORKSHEET 2: Types of sedimentary rock

### Answers

**1** Figure 8.2.1 is clastic, Figure 8.2.2 is chemical and Figure 8.2.3 is organic.

**2** The key processes are: sedimentation, compression and cementation (cementing).

**3** Water evaporates from a solution and crystals begin to form. When all the water is gone the crystals remain and become cemented together.

**4** Plant material that fell into a swamp was covered in sediment and gradually compressed. It slowly decomposed and was changed by heat.

**5** Figure 8.2.4 shows that clastic sedimentary rocks have the typical features of layers, grains that do not interlock, and often they have fossils.
