Physical and Chemical Change

Physical changes= a change in state or shape of materials. Now mew substance made. It can usually be reversed.

Chemical changes=a change where a new substance has been made. It can usually not be reversed.

Certain things indicate that it is a chemical change. These do not happen in all chemical changes, but if they do occur it may show that a chemical change has occurred. These things can include a colour change, a gas being given off, heat being given off or taken in, a new solid being produced or light being produced

Situation	Chemical or physical change?
Ice melts	
Iron rusts	
A cake is baked	
Putty is squashed into a different shape	
Wood burns	
Water freezes	
Cutting paper	
Water is poured into a cup	
Food rots	
Gas burns in a Bunsen burner	
Food digests in the gut	
Oil burns in an oil lamp giving off light	
Food left out of the fridge starts to smell bad after a day or two.	
An old banana turns black
