Year 8 Science
The Human Digestive System.

Use your textbook and your laptop to label the following diagram, colour it in and fill in the table below.

Letter	Colour	Organ's name	What does it look like? (structure)	What does it do? (function)	What type of digestion (if any) is it involved with?
A		Mouth	Teeth and tongue. Cavity in which food is chewed	Mixes food and saliva. Breaks food down into smaller pieces	Chemical: enzyme in saliva breaks chemical bonds Mechanical: Teeth breaks food into smaller pieces
B		Epiglottis	Flap that separates oesophagus and trachea	Closes off your trachea so that food doesn't go down to your lungs	None
C		Oesophagus	Hollow tube lined with mucous and cartilage rings	Transports food to the stomach using involuntary muscular contractions	None
D		Stomach	J-shaped organ. Muscular walls. Contains hydrochloric acid	Muscles mix food with gastric juice and breaks down proteins.	Mechanical: Muscle movements separate food Chemical: gastric juice breaks proteins into smaller molecules
E		Small Intestine	6m long tube. Contains enzymes	Digests most food	Chemical: Enzymes break down molecules into smaller ones. Mechanical: Separates food by peristalsis
F		Large intestine	1.5 m long tube. Wider than the sml int.	Absorb water, salts and vitamins	None
G		Rectum	Final part of the large intestine	Stores faeces before removal	None
H		Anus	Ring of muscle	Controls removal of faeces	None
I		Salivary glands		Release saliva into the mouth	Chemical: releases enzymes that break down starch

J		Liver	Largest organ	Makes bile, which breaks down fats.	None
K		Gall Bladder	Hollow organ	Stores bile	Mechanical: bile separates fats.
L		Pancreas	Looks like a sponge	Release pancreatic juice, containing enzymes that break down proteins, fats and carbohydrates.	Chemical: secretes enzymes which chemically break down substances
