

Problem: How are bird beaks and feet adapted for different purposes?

1. List 3 different ways birds could use their beaks.

2. List 3 different ways birds could use their feet.

3. Define: Natural Selection

Procedure:

1. Collect materials for your lab group:
   - Spoon
   - Chopsticks
   - Forceps (Tweezers)
   - Stopwatch
   - Marbles
   - Coins
   - Toothpicks

2. Make a prediction: What tool will pick up each 'food' the best?
3. Three members of the group take a tool (spoon, chopstick, and tweezers). Fourth member collects data.
4. The Data collector will time group as they race to pick up as much food as possible (coins, toothpicks, marbles) in one minute.
5. Lab group must organize data into a data table including a chart showing how much food each tool picked up (example: the spoon got 7 marbles, 1 coin, 0 toothpicks).

Post-Lab Questions

Which beak is best adapted for marbles? Toothpicks? Coins?

Which beak survives in an environment with only marbles? Toothpicks? Coins?

4. What kind of food could each of the below birds eat with their beak?

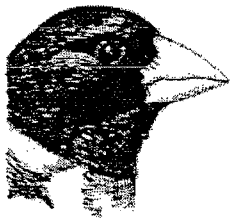

1 _____

2 insect-and fruit-eating beak

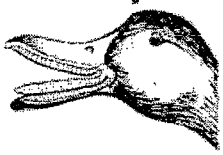

3 _____

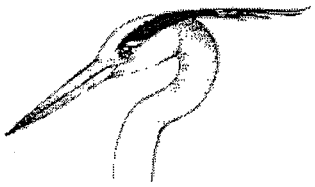

4 _____

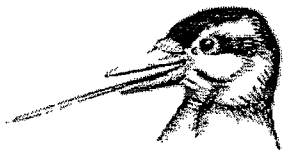

5 _____

6 _____

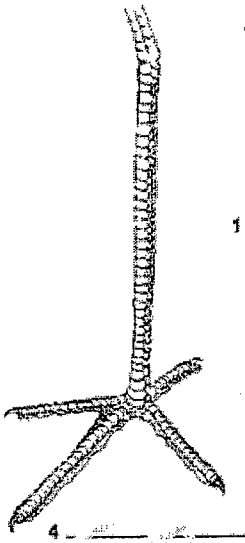

7 _____

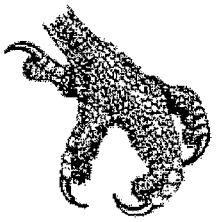

8 _____

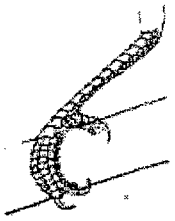

5. What environment could each of the following types of feet best be adapted for?

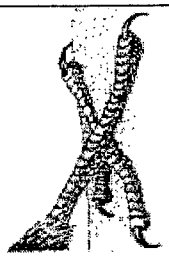

4 _____

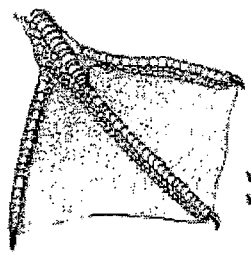

1 _____

2 _____

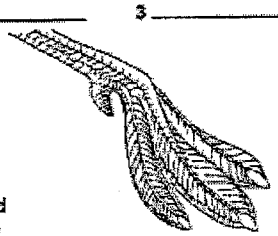

3 _____

webbed version

5 _____

lobed version
