Here, there – but not everywhere

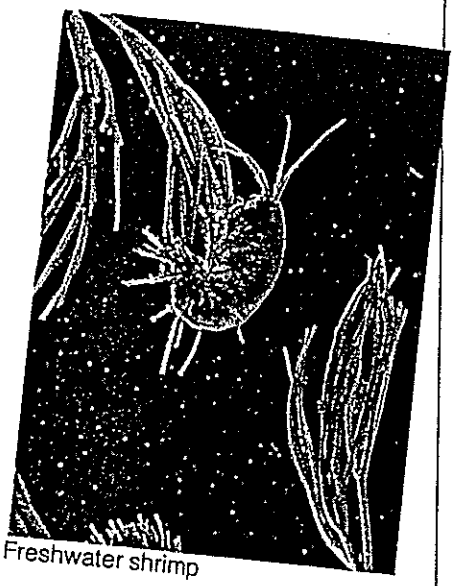

Even shrimps can be choosy

If you look carefully, you can usually find freshwater shrimps in a stream. But they are not found everywhere. They seem to prefer living in some parts of a stream rather than others.

All parts of a stream are not the same. For example, in some parts the water will flow quickly, in other parts it will flow slowly. Some parts of a stream are shallow, others are deep. Some parts have mud at the bottom and others have pebbles.

1 Suggest three things which might decide which parts of a stream freshwater shrimps prefer.

2 You can find out how fast a stream is flowing by droppin in a piece of wood and timing how long it takes to be carried a fixed distance. The table shows the results of doing this three times for the same part of a stream.

Freshwater shrimp

	first time	second time	third time
distance travelled (metres)	36	36	36
time taken (seconds)	36	18	20

Steam speed results

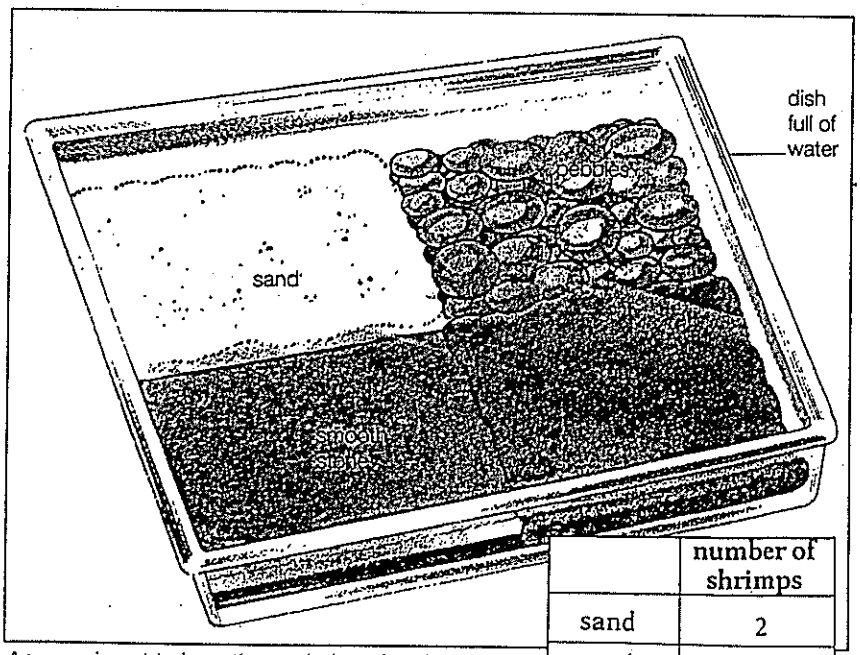

a At what speed (in metres per second) does each result suggest that the stream is flowing?

b Why do you think that the three results were not all the same?

c What was the average speed of the stream?

Shellfish decisions

The diagram shows the apparatus used to try to find out if freshwater shrimps prefer a particular sort of surface. Twenty shrimps were put into the water at the centre of the dish. The apparatus was left for an hour and then the number of shrimps that had settled on each surface was counted. The results are shown in the table.

An experiment to investigate choice of surface by freshwater shrimps

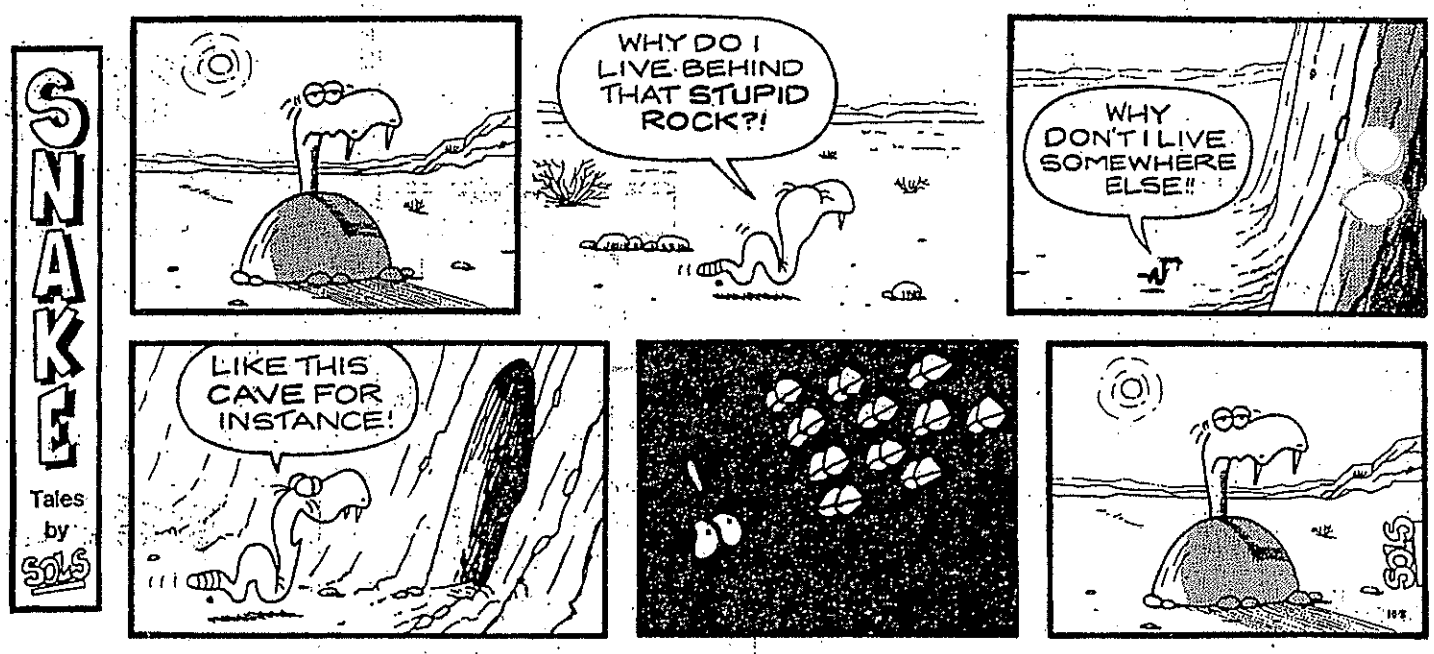

3 Which surface did the shrimps seem to prefer?

4 Draw a bar chart to show the results.

5 Suggest two things which would have to be kept the same for all parts of the dish during the experiment.

	number of shrimps
sand	2
mud	14
pebbles	3
stone	1

Distribution of shrimps
