PLANT CELLS

In this worksheet you will learn about plant cells.

Plant cells have the parts that you have learnt about for animal cells and two extra parts that are *not* found in animal cells. These parts are the cell wall and chloroplasts.

To make cells easier to understand, once again you will need to learn some new words. Some of these words are difficult to spell and to say so you can practise them.

Word	Meaning
Cell wall	A boundary around the cell that gives the plant cells a definite shape. Plant cell walls help to give plants shape because plants do not have bones or skeletons like many animals.
Chloroplast	Green parts of plant cells that carry out the chemical reaction called photosynthesis. Photosynthesis turns light energy from the sun into chemical energy (carbohydrates) that animals can use for energy to survive when the plants are eaten.

special words

plant cell
animal cell
cell wall
chloroplast
cell membrane
nuclear membrane
vacuole
ribosome
chromosome
cytoplasm
nucleus
mitochondrion
mitochondria

To do

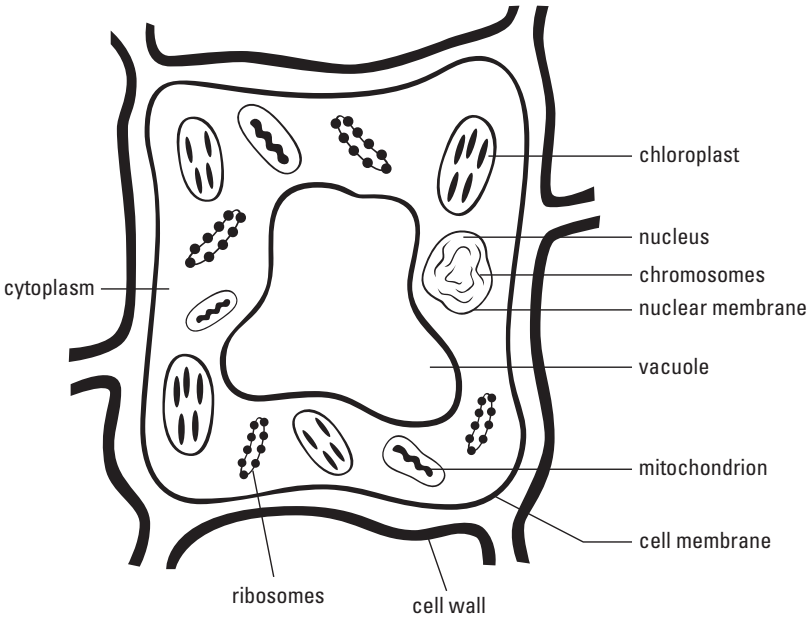

1 Write out each of the words twice in the spaces that you have been given.

cell wall	chloroplast

Cell membrane, nuclear membrane, vacuole, ribosomes, chromosomes, cytoplasm, nucleus, mitochondrion (many mitochondria), cell wall and chloroplast are all parts of plant cells.

On this page and the next are some drawings that show what plant cells can look like and what the parts of plant cells look like. Cells from different plants look different because each cell has a different job.

To do

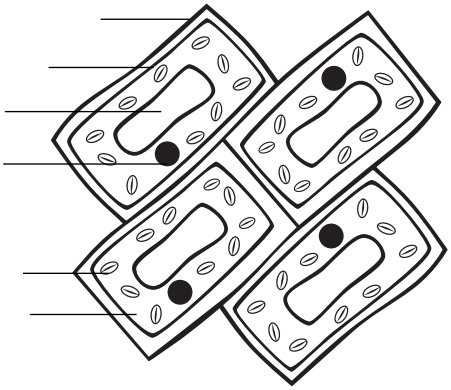

2 Using the labels on the plant cell as a guide, label the parts of all the cells on this page.

3 Now make your own plant cell.

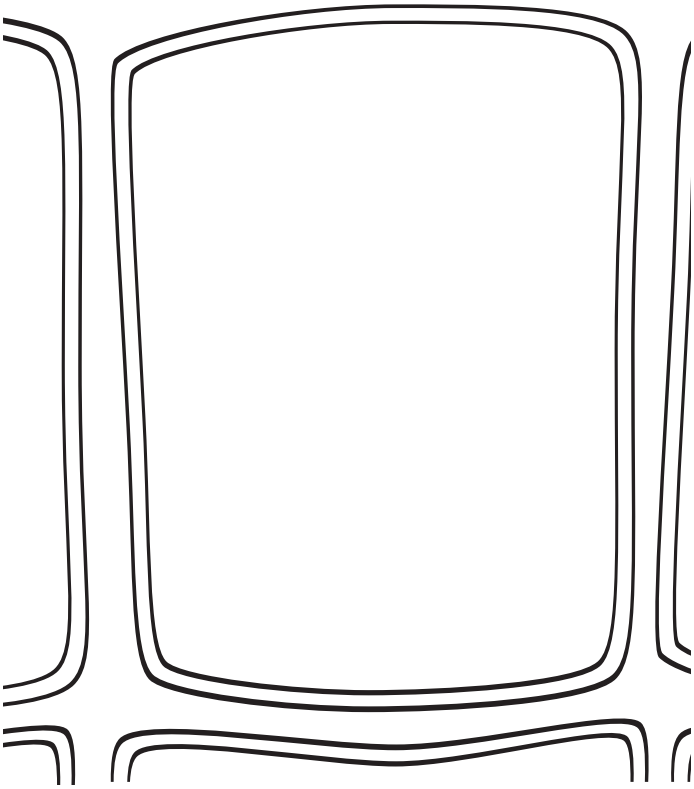

- Cut out the cell parts from below.
- Colour in the parts so that they will be easy to see. Make sure that each of the cell parts has its own colour.
- Paste the parts onto the page using the plant cell on this page as a guide.

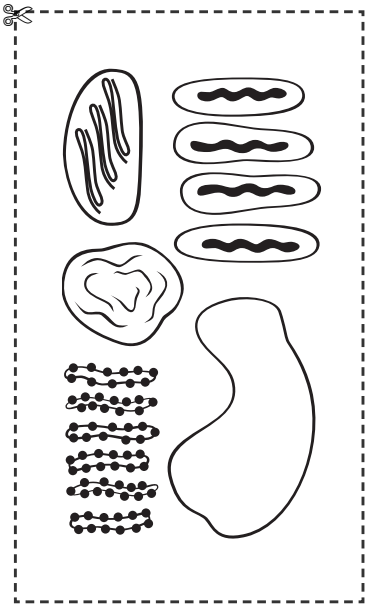

Onion cells

Pondweed cells
