Bunsen burners

Label the parts of the Bunsen burner below.

[air hole, barrel, base, collar, gas tube, top]

Using a Bunsen burner

When using a Bunsen burner you should always follow these steps:

1. Clear the work area and place a bench mat under the Bunsen burner.
2. Close the air hole of the burner by turning the collar.
3. Light a match and hold it at the top of the burner, but not directly over the hole.
4. Turn on the gas and light the burner.
5. Leave the collar closed and the yellow luminous flame burning until a hot flame is needed.
6. Slowly turn the collar around to open the air hole if you need a hotter flame. If the burner flame goes out, turn off the gas and start again.

Safety

These are some important rules to follow when using a Bunsen burner.

1. Always follow the steps described above when lighting a Bunsen burner.
2. Do not lean over a Bunsen burner because your hair or clothes could catch alight or you could be burnt.
3. When not using the burner for heating, close the collar to produce a yellow luminous flame – it is easier to see and there are less likely to be accidents.
4. When heating a test tube over a Bunsen burner, make sure that the open end is not pointing at anyone in case some of the contents spit out of the test tube.

Cut and paste

A student wishes to heat a test tube full of liquid in a Bunsen burner. Cut out each of the following diagrams and labels, and paste them into your book in the correct order, matching the correct label to each diagram.

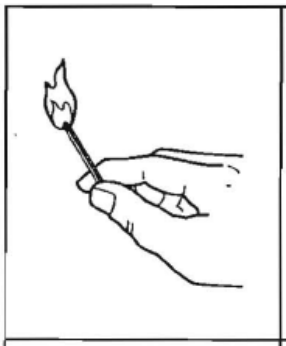

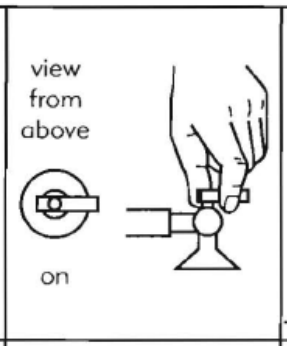

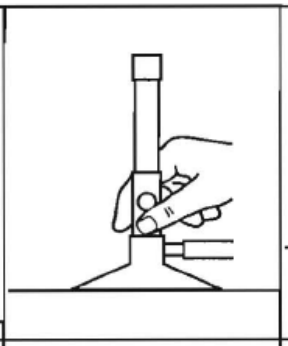

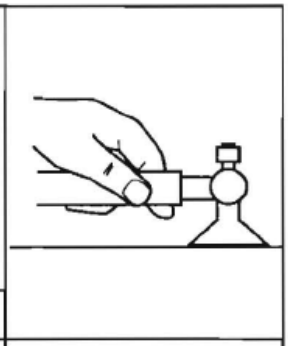

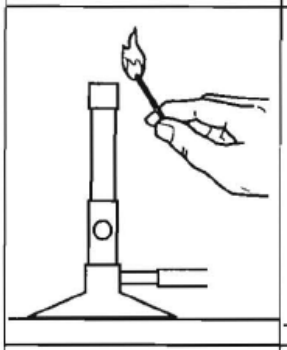

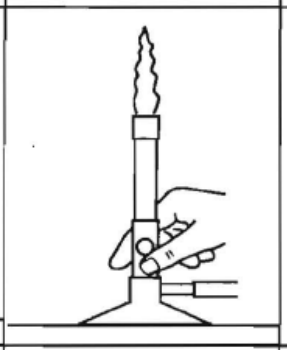

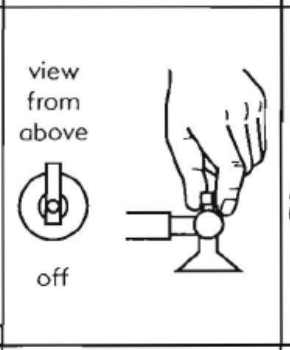

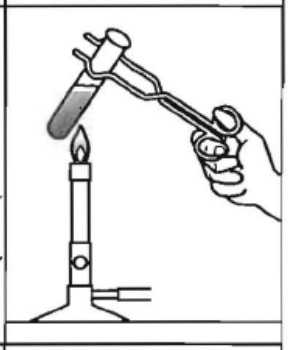

Key

airhole closed

airhole open

				
				
Close the air hole.	Hold the test tube above the Bunsen burner.	Light a match.	Turn off the gas tap.	Close the air hole again.
Open the air hole.	Blow out the match.	Place flame of match near top of Bunsen burner.	Attach the rubber hose of the Bunsen burner to the gas tap.	Turn on the gas at the gas tap.
