Gas Exchange

Name:_____

This happens in the _____ inside the lungs.

_____ (O_2) in the alveolus is <u>exchanged</u> for _____ _____ (CO_2) in the blood.

Air which has been _____ has a higher concentration of Oxygen and a _____ concentration of Carbon Dioxide.

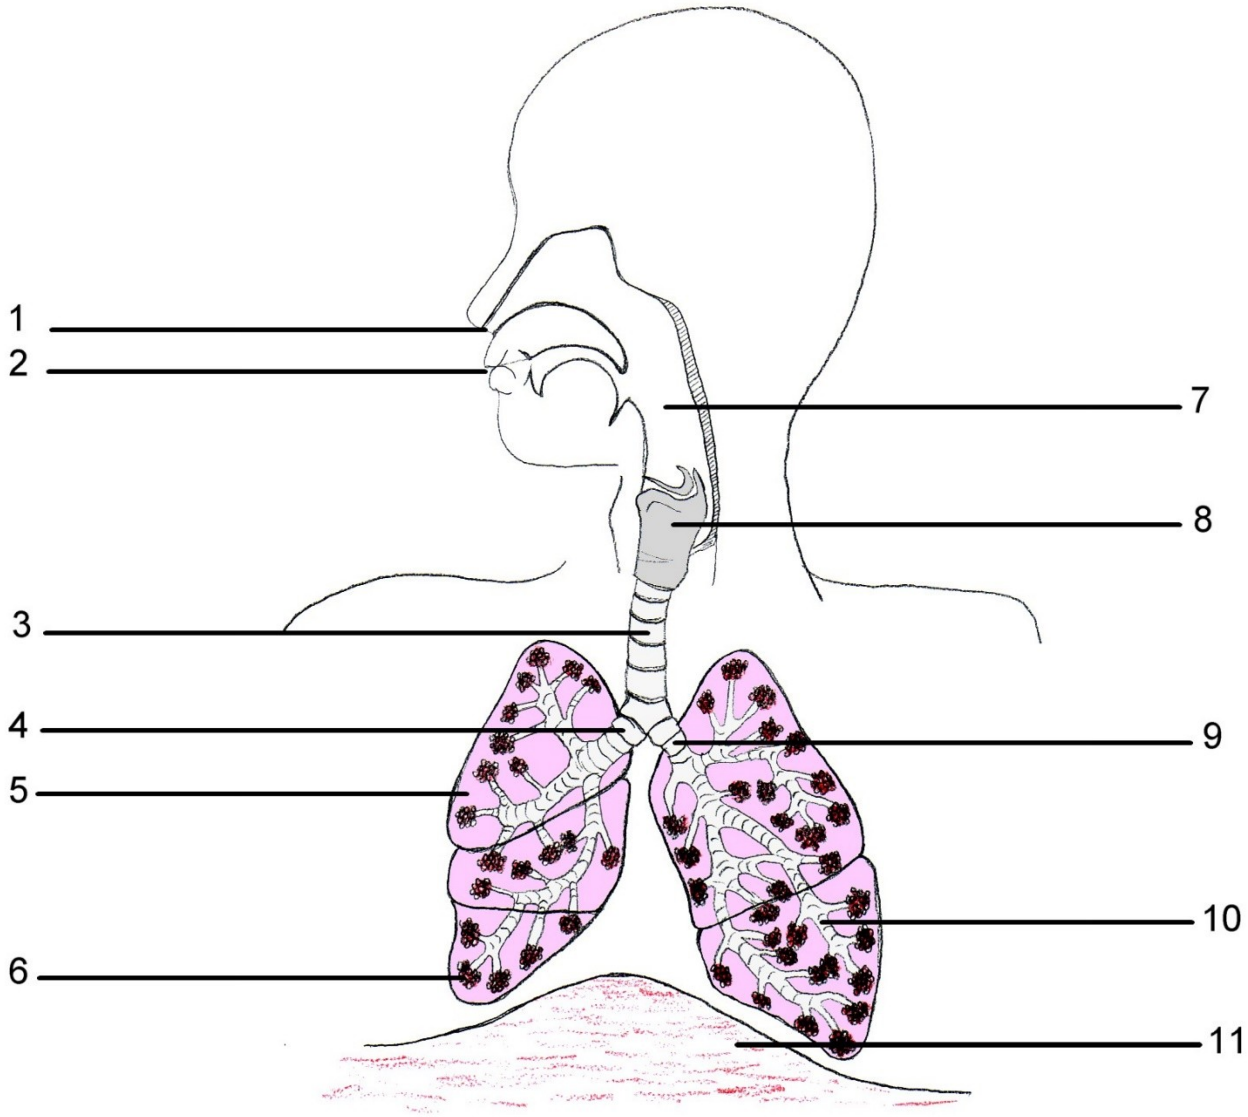

Blood which has travelled around the body has a _____ concentration of Carbon Dioxide and a _____ concentration of Oxygen.

These gasses are exchanged in the alveolus via _____.

So the blood leaving the lungs is now higher in Oxygen and lower in _____ _____. The air which is exhaled from the lungs is higher in Carbon dioxide and lower in _____.

Label the arrows on the diagram below to show what happens during gas exchange.

The Human Respiratory System

Label the features you recognise on the following diagram. Draw in some alveoli
