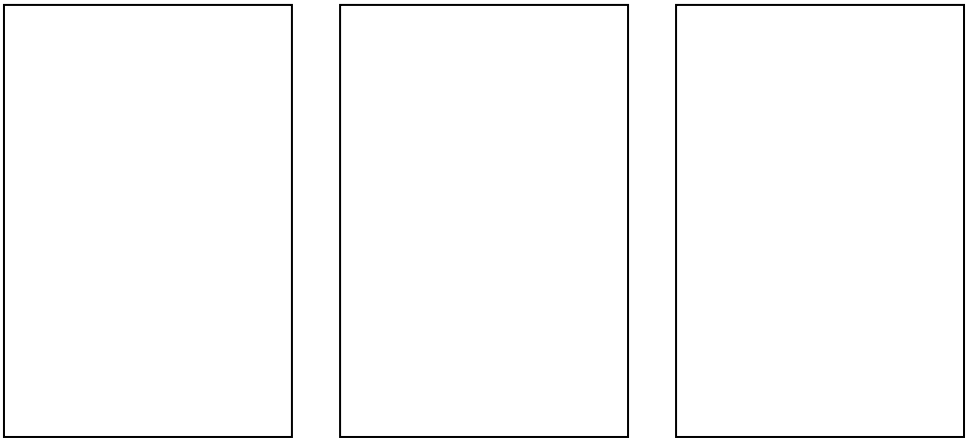
The Particle Model

Solids, liquids and gases are all made of tiny **particles**.
Draw how a solid, liquid and gas would look in a container.



Solid liquid gas

Use the diagrams above to help you answer the following questions:

1. You can squeeze more air into a bicycle tyre that already has plenty of air inside it. Explain why.

2. Why **can't** you squeeze more water into a bottle that is already filled with water?

3. Why can you pour a liquid but not a solid (unless you crush the solid and make it into a powder)?

4. Solids and liquids are a lot **denser** than gases. What does this mean?
